REPORT

OF THE

COMMISSIONER OF FISH AND FISHERIES FOR 1875-'76.

MAY 31, 1876.—Ordered to lie on the table and be printed.

UNITED STATES COMMISSION FISH AND FISHERIES,
Washington, April 25, 1876.

GENTLEMEN: In compliance with the order of Congress, I transmit herewith my report for 1875-'76 as United States Commissioner of Fish and Fisheries, embracing, first, the results of inquiries into the causes of the decrease of the food-fishes of the sea-coast and lakes of the United States; and, secondly, the history of the measures taken for the propagation of food-fishes by stocking the rivers and lakes with shad, salmon, and other valuable species.

Very respectfully, your obedient servant,

SPENCER F. BAIRD,
Commissioner.

Hon. T. W. FERRY,
President of the United States Senate; and
Hon. M. C. KERR,
Speaker of the House of Representatives.

CONTENTS.

I.—REPORT OF THE COMMISSIONER.

A—GENERAL CONSIDERATIONS.

Page.

1. INTRODUCTORY REMARKS *1
Operations of previous years *1
Precaution and time required by the work *1
Danger of hasty generalizations *1
Methods and direction of research *1
Utilization of work already performed by other departments of the government *2
Corresponding labors of other nations *2
Rapid increase in the work of the United States Fish Commissioner *3
Originally confined to inquiry into the present condition of the fisheries *3
Multiplication of food-fishes subsequently added *3
No intermission in the work of the Commissioner *3
Amount of correspondence *3
Principal associates and assistants in the work *3
Fisheries branch *4
Distribution branch *4
Period of time covered by the report *4

B—INQUIRY INTO THE DECREASE OF THE FOOD-FISHES.

2. INVESTIGATIONS AND OPERATIONS OF 1875 ..... *4
Selection of Wood's Holl as a station *4
For comparison of results with those of 1871 ..... *4
Convenient point for preparing fishery exhibit at Philadelphia in 1876 ..... *5
Detail of steamer Blue Light by the Navy Department *5
Beginning of the work *5
Associates, assistants, and visitors *5
Establishment of a permanent laboratory *6
Location and building furnished by the Light-House Board *6
The fitting up, mainly by private contributions *6
Close of season *6
Statistics of whale fishery *6

3. INVESTIGATIONS AND OPERATIONS OF 1876 ..... *7
Unofficial work at the Wood's Holl laboratory *7
Presence of the Commissioner required at the Philadelphia exposition *7
Fisheries, and fish-culture exhibit at Philadelphia *7
Extent of the display *8
Fish-hatching exhibit *8
Fresh-fish exhibit *8
Acquisition of foreign fisheries exhibits *8
Hope of reproducing it in Washington *8

C—THE PROPAGATION OF FOOD-FISHES.

4. GENERAL CONSIDERATIONS *8
Summary of results accomplished *8
Application for eggs and young fish *9
Rapid increase in their number *9
Response by Congress to public demands *10
Limitations of distribution *10
Theory of distribution *10
Foreign applications *11
Reasons for granting them *11

Page.

4. General considerations—Continued.
Distribution of eggs and fish young *11
Species covered by operations of United States Fish Commission *11
Species covered by State commission and private parties *11
Relation of the United States Fish Commission to the American Fish Culturists' Association. *11
Relations to State fish commissions *12
Increase in number of State commissions *12
Annual conferences *12
Meeting at Philadelphia in 1876 ..... *12
Advantages of co-operation *12
Nature of co-operation effected *13
Sharing of expenses *13
Moral support *14
Interstate relations and co-operation *14
Relations to the Executive Departments of the government *14
Relations to private individuals *14
Relations to foreign countries *15
Germany—
Organizations *15
Individuals *16
Japan *16
Canada *16
Other foreign countries *17
Facilities furnished by railroad companies *17
Facilities furnished by express companies *18

5. Actual work of propagation of food-fishes in 1875 and 1876 ..... *20
The shad *20
Season of 1876 ..... *20
The Potomac River station *20
The Susquehanna River station *20
The Connecticut River station *21
Combined results *21
The California salmon *21
The Columbia River station in 1875 ..... *21
Threatened decrease of the fishery *21
Selection of hatching-station *22
The McCloud River station in 1875 ..... *22
Previous history *22
At first occupied part of year only *23
Object and need of permanent occupation *23
Established as a government reservation *23
Commencement of operations in 1875 ..... *23
Distribution of eggs to States *23
Distribution of eggs to foreign countries *23
Hatching of fish on account of the United States generally *23
Supply of fish to the Sacramento *24
Co-operation of California *24
The McCloud River station in 1876 ..... *24
Results of the season *24
Use of refrigerator-car for shipping the eggs *24
Distribution of eggs *24
To the States *24
To foreign countries *24
Supply of fish to the Sacramento *24
The Atlantic salmon *25
Season of 1876 ..... *25
Temporary suspension of work *25
The land-locked salmon *25
General nature and geographical distribution of the fish *25
Union with Massachusetts and Connecticut in prosecuting the work *25
History of previous operations *25
Sebec Lake in 1873 ..... *25
Sebec Lake in 1874 ..... *25
Grand Lake stream in 1875 ..... *25
Grand Lake stream in 1876 ..... *26

REPORT OF THE COMMISSIONER.

A—GENERAL CONSIDERATIONS.

1.—INTRODUCTORY REMARKS.

The operations of the United States Fish Commission commenced in 1871, in pursuance of a law passed February 9, 1871, which authorized and directed the appointment by the President of a Commissioner to investigate the alleged diminution of food-fishes along the sea-coast and in the lakes of the United States; and, if this proved to be the case, to suggest the proper method for restoring the supply. Having been selected by the President for the duty in question, the work was begun during the summer season of that year at Wood's Holl, a village on the southwestern portion of Cape Cod, situated on the steamboat-route between New Bedford and Martha's Vineyard. It was continued in 1872 at Eastport, Maine; in 1873 at Portland, Maine; in 1874 at Noank, Conn., on Fisher's Sound; and in 1875 at Wood's Holl for the second time. In this way a general and preliminary idea of the character of the coast and its fisheries was secured, and an important foundation laid for finally carrying out the objects of the research.

It will, of course, be understood that a question admitting of so much argument and involving so much antagonism on the part of those whose interests are concerned cannot be solved in a day, and that caution is necessary before announcing any conclusion that is not thoroughly and entirely based upon well-established premises. The operations of natural and artificial causes must be watched for a period of several years, for the purpose of eliminating what is extraneous, and of fixing attention upon that which alone has a direct bearing upon the problem.

A similar research, commencing at about the same time, has been carried on by the German Government, in some respects on a much larger scale than that prosecuted by the United States; and in Germany, as here, the data for a final decision have not yet been attained. Some of the conclusions published in the Report of the United States Commission for 1871 have not been entirely verified, especially as to the influence of certain agencies upon the fish-supply; and it is only after a patient and careful consideration of all the circumstances that a deduction can be reached which may be considered as authorizing measures of legislation.

The work of the Fish Commission, in the proper investigation of this subject, requires the application of many branches of science and the concurrence of numerous specialists. This requires a thorough knowledge of all the conditions—physical, mechanical, and biological—of the waters, the habits and characteristics of their inhabitants, and the collecting of accurate statistics of the catch; and all these data must be known for a period of years, although it is hoped that the Commission has nearly reached the point when deductions somewhat definite can be made. In the inquiry into the conditions of the ocean and its inhabitants, it is, of course, not necessary to go over the ground already covered by other branches of the government. Thus the hydrography of the coast, the general character of the sea-bottom, the nature of the tides, etc., are well pointed out in the charts of the Coast Survey and of the Hydrographic Office. There are required, however, in addition to what is available, long-continued and careful observations of the temperatures of the water at the surface, at the bottom, and at intermediate points—these studied in connection with the local conditions of the atmosphere; determinations of the chemical composition and of the density of the water; of the precise relation of the various portions of the sea-bottom or of the water to the entire animal life—to be shown only by the use of the trawl, the dredge and the towing-net; a study of the successive stages of animal life throughout the different seasons of the year; an examination of the vegetation, especially of the different species of algæ, which also have an important relation to the problem—all these and other subjects have been considered by the Commission, with the assistance of eminent naturalists and physicists in the various branches of the inquiry.

The only foreign governments by which a precisely similar inquiry has been carried on are those of Germany (already referred to), Norway, and Sweden, the two latter having been especially diligent in the research, bringing all the national resources to the aid of the fisheries, not only in determining their theory, but also in facilitating their practice.

The Norwegian Government, especially, not only keeps a government vessel, with one of its most eminent zoologists, Prof. G. O. Sars, and several assistants, on the great cod and other sea fishery grounds during the season, to determine all the points in which assistance can be rendered to the fishermen, but it has actually constructed a line of telegraph, mostly submarine, along the entire coast and stationed patrols at short intervals, by means of which the casual occurrence of a school of herring at any point along the coast is immediately communicated to all the fishermen, who can then unite and utilize what may be the only opportunity of the year to secure a full fare.

The publication of the results of these inquiries on the part of Europe and America, has added a vast amount of information, both theoretically and practically important.

As already stated, the original object of the creation of the United

States Commission was simply to carry on the inquiry just referred to, and a small appropriation was sufficient to meet the cost, especially as Congress, by its act, directed that all the executive departments of the government should render such aid to the Commission as might be in their power.

In the second year, however, of the Commission an additional feature was ingrafted, namely, that of the propagation and actual multiplication of the food-fishes.

At the meeting of February 7, 1872, of the American Fish-Culturists Association, a committee was appointed to memorialize Congress as to the importance and necessity of actual aid in restoring fish to the depleted waters of the United States, or in stocking them with new and useful food-fishes.

This committee, of which Mr. George Shepard Page was chairman, appeared before the Committee on Appropriations of the House of Representatives and presented their case. A favorable conclusion was reached, and the sundry civil bill as reported contained an appropriation of $10,000 for the purpose. This, however, was rejected by the House; but an item of $15,000, inserted by the Senate, became a law, thus establishing a new feature in the work of the Commission. Since then increasing appropriations have been made year by year.

The country fully sustained the action of Congress in giving the experiment a fair trial, being well satisfied that if successful the benefits would be vastly more than proportionate to the expenditures. The public sympathy with the subject has also been shown by the fact that since the establishment of the United States Fish Commission a large proportion of the States have organized state commissions for the purpose of looking after the interests of their waters and of co-operating with the United States Commission toward the accomplishment of a common end.

The active field-work of the United States Fish Commission, therefore, formerly confined to the summer, now embraces almost the entire year—the hatching of shad covering a period from March until August; that of the California salmon from June until November; of the Penobscot salmon from June until the ensuing March or April; of the Landlocked salmon from September until March; and of the whitefish from October until March.

An enormous and constantly increasing correspondence is necessarily maintained throughout the year, the applications for fish, inquiries as to proper methods of stocking certain waters, the arrangements necessary for the movement of the fish and their introduction into suitable localities, and attention to other business details, making a very onerous and exhaustive aggregate of office-work.

Each department of the field-work has a special expert in charge of it, to whose industry, energy, and ability, the Commission owes whatever success it has met with in prosecuting its labors. Thus, for the sea-

coast inquiry, the subject of the invertebrate marine animals has been in charge of Prof. A. E. Verrill, with assistants varying in different years; that of the vertebrates, in charge of Mr. G. Brown Goode; Mr. J. W. Milner, assistant fish commissioner, while rendering aid in the general details of the fish-producing department, has entire charge of everything connected with the hatching and distribution of the shad, as has Mr. Charles G. Atkins of the Sea- and Landlocked salmon establishments in Maine, and Mr. Livingston Stone of the salmon-fishing station on the McCloud River. To all of these gentlemen I am happy thus to render a public acknowledgment for hearty and efficient service.

To Mr. T. B. Ferguson, the very able commissioner of Fisheries of the State of Maryland, I am indebted for most important co-operation in the hatching of shad and salmon for distribution throughout the country, his machinery and hatching establishment having been freely at my command, and his men employed at various times in the transportation of the latter fish. The aid of other State Fish commissioners will be referred to hereafter.

The difficulty of confining the annual report of operations to the cardinal year has been already explained, the shad-hatching work for a given season alone commencing and finishing between January and December. The other branches have usually been considered in each report from their commencement to their close, which consequently involves the carrying of certain topics into the following year. The last published report of the Commission, or the third, embraced the seasons of 1873–'74 and 1874–'75; the present one (or the fourth) will be less extensive, but while bringing the history of a certain portion of the operations up to the beginning of 1877, will also include some matters that should have appeared in a preceding volume but which was not furnished in time by the authors. The history of the operations of the Commission, therefore, in the present volume will, as usual, be given under the two heads of the Inquiry into the Sea and Lake Fisheries, and the Propagation of Food-Fishes—the former covering the whole of the years 1875 and 1876; the latter, 1876 and the early part of 1877.

B—INQUIRY INTO THE DECREASE OF FOOD-FISHES.

2.—INVESTIGATIONS IN AND OPERATIONS OF 1875.

The successive centers from which investigations into the subject referred to were prosecuted have already been mentioned as being at Wood's Holl, Eastport, Portland, and Noank. Wood's Holl was again selected as a station in 1875, as the interval of four years which had elapsed since the commencement of the work at the same place rendered it probable that a second visit at this time would give the means for determining the amount of variation in the fish-supply. An additional object in taking this station was its convenience in securing material for the fisheries display of the International Exhibition at Philadelphia in

1876. An appropriation was made by Congress, in the early spring of 1875, to enable the various executive departments of the Government to present an exhibit of the character and extent of their operations, to include a representation of the animal, vegetable, and mineral resources of the United States, and their primary applications to the wants and luxuries of man. Among the departments designated by the act was the United States Fish Commission, for the purposes of which an appropriation of $5,000 was made.

As the south coast of New England furnished an excellent ground for securing a portion of the material for this exhibition, Wood's Holl, as being the most convenient station yet established by the Commission, was found to be very available.

Reference, in the previous report, has been made to the supply, under the law, by the Navy Department, of the steam-tug Blue Light, a staunch vessel of about 85 tons, and well adapted for the inshore work. Her first cruise in the service of the Commission was at Portland; her second, at Noank. She was again furnished by the Department in 1875, and, as before, was under the command of Commander L. A. Beardslee. Dr. J. H. Kidder was detailed to act as surgeon and naturalist, having acquired well-merited distinction while serving in a similar capacity during the Transit of Venus Expedition, on board the Swatara, and at Kerguelen Land.

The Commissioner reached Wood's Holl on the 21st of June, with his assistants, and immediately commenced his labors, the field of inquiry and research being proportionally enlarged on the arrival of the Blue Light on the 12th of July.

As before, the inquiry into the invertebrate animals was prosecuted under the direction of Prof. A. E. Verrill, assisted by Mr. S. I. Smith, Mr. S. F. Clark and Mr. C. Hart Merriam. The work connected with the fishes and cetaceans was directed by Mr. G. Brown Goode, assisted by Mr. Tarleton H. Bean, Capt. H. C. Chester and Mr. Vinal N. Edwards. With the special object of securing illustrations for the Centennial display, the services of Messrs. J. H. Blake and J. H. Richard, artists, T. W. Smillie, photographer, and Mr. William Palmer, modeler, were engaged.

As usual, a number of scientific specialists embraced the occasion furnished by the facilities and opportunities of the Commission to visit Wood's Holl for the purpose of carrying on their investigations, remaining there during the greater part of the season. Among these may be mentioned Prof. A. Hyatt, custodian of the Boston Society of Natural History; Dr. William G. Farlow, professor of botany in Harvard College; Dr. H. A. Hagen, of the Museum of Comparative Zoology, Cambridge; Mr. Symonds, of the Boston Natural History Society; Prof. Theodore Gill and Mr. William H. Dall, of Washington; Mr. Sanderson Smith, of New York; Prof. D. C. Eaton, Mr. Oscar Harger, and Mr. J. K. Thatcher, of Yale College. Wood's Holl was also visited for shorter periods by numerous persons interested in the operations of the Commission and desirous of witnessing their nature; among them Mr.

William C. Wyckoff, the scientific editor of the New York Tribune, who, as in previous years, gave through the columns of the Tribune an extended and popular account of what was being done.

Wood's Holl Laboratory.—At the various summer stations of the Commission, temporary and sometimes inconvenient quarters were alone available for the reception and investigation of the collections. The necessity for more permanent accommodation for 1875 was felt very urgently, especially on account of the connection of the operations with the Centennial exhibit. The Light-House Board has had for several years a station at Wood's Holl for the storage of material and supplies required for the light-houses and light-vessels of the Second Light-house District, and as a station for the buoy-tender. A large shed, not immediately needed for the purposes of the light-house establishment, was, by permission of the Board, altered so as to constitute a convenient laboratory for the purposes just mentioned, an additional story having been attached and an open portion of the first story being inclosed. This was done at the expense of the appropriation of the Fish Commission, and was found, when completed, to answer a most admirable purpose, being thus provided with two floors or stories, each floor being sufficiently solid and substantial for the prosecution of microscopical investigation. A reservoir of 5,000 gallons capacity was erected, and filled by a windmill air-pump; and from this, water was conducted through pipes into both stories and distributed to the various tanks, aquaria, and other working apparatus of the Commission.

The establishment was suitably fitted up with tables, presses, jars, and other necessary appliances; and, with the exception of the building erected by Professor Agassiz at Penikese, is the first formal and permanent sea-coast laboratory constructed and put into operation, especially for the purpose, in the United States.

The expense of fitting up the interior of the laboratory, plumber's work, the aquaria, etc., was met from contributions kindly furnished by Mr. and Mrs. John M. Forbes, of Naushon, and Mr. Robert L. Stuart, of New York, to whom a public acknowledgment is due for their liberality. The Hartford Automatic Windmill Company is also to be considered as a contributor, having deducted $100 from their bill for the pumping apparatus.

As the work of the Commission was continued through the season with very great success, important facts in regard to the fishery inquiry were obtained (which will form the subject of a special report), and very large collections of marine animals for exhibition were secured. The season closed with the departure of the Blue Light for her station at New London on the 29th of September, and on the 30th the various members of the party left for their respective homes.

Statistics of the whale-fishery.—Among the objects to which the inquiry of the Commission has been directed is that of the condition of the American whale-fishery and the causes of its decline. Some time was spent at Nantucket in the prosecution of inquiries on this subject, that

place having been formerly the center of operations in the whaling business, although now without a single whaling-vessel in service.

Finding that Mr. Alexander Starbuck, of Waltham, Mass., had been engaged in a somewhat similar inquiry, arrangements were made with him to prepare a special account of the subject, which might at the same time serve as a Centennial report. The result of his inquiries is submitted in the present volume, of which it constitutes 765 pages. In addition to a general history of the whale-fishery from almost its very commencement, the report includes a list of nearly every American vessel which was ever engaged in the business, the name of its captain, its agent, its field of operations, and its catch; also the varying quantities of oil, sperm, and bone obtained, and their average prices for each year, the whole involving a great amount of research, with a result extremely creditable to the author.

3.—INVESTIGATIONS AND OPERATIONS OF 1876.

The necessity of attendance upon the International Exhibition at Philadelphia, in the capacity of superintendent of the exhibits of the Smithsonian Institution, of the National Museum, and of the United States Fish Commission, prevented any active work being done under the immediate direction of the Commissioner during the season of 1876, and no application was made to the Navy Department for the use of a steamer as in the three previous years. The laboratory, however, at Woods' Holl, was opened for the service of a number of scientific investigators, to whom every facility and assistance was furnished by Mr. Vinal N. Edwards, in charge of the station. The results of these investigations will be available to the Commission at the proper time and place. Mr. Edwards, also, who is stationed at Woods' Holl throughout the year, continued, as heretofore, to take careful note of all the varying phenomena of the water and of its inhabitants, making collections of specimens, both of surface and deep-sea species, thus gathering many new facts for consideration. His observations during the period of the year not covered by the active work of the Commission, have given to this station a very great prominence; and there are few points, even on the coast of Europe, the natural history of which is now better known. Of over 130 species of fishes which have been obtained by the Commission from Woods' Holl, a large per cent. have been gathered by Mr. Edwards.

Government exhibit of fish and fisheries at Philadelphia in 1876.—With the International Exhibition at Philadelphia in 1876, the United States Fish Commission has had a special relation, from the fact that in the appropriations for a government display on that occasion the Commission was especially included, an appropriation being made for the expense of showing everything illustrating the methods and processes of fish culture and the apparatus and results of the American fisheries. The Commissioner was appointed by the President as one of the board of government officers, to take charge of the general display.

In the building as erected from the appropriation, a space of 6,000 feet was assigned for the exhibit of the Fish Commission; but this proving insufficient, a portion of that granted to the Smithsonian Institution was utilized, the entire surface occupied being about 15,000 square feet. Nothing was shown on this occasion but what was purely American in character, and much admiration was expressed by foreign visitors at the completeness of the collection.

Mr. T. B. Ferguson, the Maryland Commissioner of Fisheries, also exhibited his peculiar apparatus for the hatching of fishes, model of shad fishery operations, and special illustrations of the oyster industry, which were duly appreciated. In his jars were hatched out large numbers of the eggs of California salmon, furnished him by the United States Fish Commission for the purpose, which operation constantly attracted a large crowd of observers.

A noteworthy feature of the exhibit of the United States Fish Commission was a series of casts in plaster and *papier maché* of the principal food-fishes of the United States, and also of the cetaceans, marine tortoises, etc.

No special exhibits of fish culture were made at the Centennial other than by the United States and the State of Maryland, although a very complete series of the apparatus and the products of their fisheries were shown by Holland, Norway, Sweden, Japan, China, and some other countries. It is with much gratification that I am enabled to say that, with scarcely an exception, these foreign objects were all presented to the United States Government at the close of the exhibition, and are now stored in Washington awaiting that opportunity of display for which a new building has been asked.

A noteworthy feature of the exhibition was a meeting of the State Fish Commissioners, held on the 5th of October. In a subsequent part of the report the character and proceedings of this convention will be further indicated.

C—THE PROPAGATION OF FOOD-FISHES.*

4.—GENERAL CONSIDERATIONS.

The operations of the United States Fish Commission during the year have, in the main, been satisfactory. Some disappointment has been experienced in not obtaining a sufficient stock of young fish of certain species to meet all applications, but steady progress has been made, and there is every reason to hope that the problem of restoring depleted waters to their former abundance, or of furnishing an ample supply of

* It has been found impossible to confine the account of operations to any one current year, the record relating more particularly to the interval from April to April. The previous report brought the history of the propagation of food-fishes to the close of 1875 (in part into April of 1876), with the exception of that relating to California salmon, of which the statistics for the season of 1874–'75 were the latest.

But little reference has heretofore been made to carp, whitefish, and landlocked salmon, which now constitute an important element in the operations.

fish, will in time be satisfactorily solved. The rapidity with which this is done will, of course, depend upon the extent of the appropriations made by Congress, and their judicious administration.

It may be stated in general terms that important advances have been made during the past year in the methods of fish culture and of the transportation of fish, and that these have resulted principally from the labors of those connected with the various State Fish Commissions and that of the United States. The more important improvements, perhaps, have been suggested by the member of the New York State hatching establishment under Mr. Seth Green, and by Mr. T. B. Ferguson, the Maryland Commissioner of Fisheries.

Notwithstanding the very great attention which the art of fish culture has received in Europe, this country has found little occasion to adopt any foreign methods or processes; indeed, the American methods have been received with very great favor in Europe, and constant applications have been made for descriptions, drawings, and models of the American apparatus.

Applications for eggs and young fish.—In the infancy of the operations of the United States Fish Commission, the Commissioner and his assistants were obliged for the most part to make their own selections of suitable places of deposit of the young fish. With the rapid increase in the number of State commissioners much of this responsibility has been removed; the latter gentlemen, having better knowledge of the character of the waters and the most suitable points for the introduction of the fish, in many cases receiving the eggs from the United States establishments and having them hatched out at the expense of the State or of private subscriptions.

There has also been a very rapid increase, very largely through members of Congress, in the number of applications for the benefits of the Commission. The ratio of the increase, and the character of the applications made, will be best understood by the following table, which exhibits the number and character of applications for fishes from 1873 to 1876, inclusive. From this it will be seen that the California salmon is in greatest request:

	Number of applications.
1873	19
1874	42
1875	52
1876	174
Total	287

Shad	88
California salmon	123
Atlantic salmon	27
Land-locked salmon	38
Whitefish	9
Eels	2
Total	287

While every effort has been and will continue to be made to meet all reasonable calls for eggs and fish, the limitations in this respect may be easily appreciated, these relating more particularly to the appropriation, the possibility of obtaining a sufficiency of spawn, and the time required for training a select body of men for the special service required by the Commission.

Congress, from the beginning, has shown an appreciation of the importance of the object of the Fish Commission, and has furnished all the assistance for which application has been made. The appropriations have been increased from year to year as a judicious expenditure became possible.

The ability to secure a supply of eggs of the food-fishes is a matter depending largely upon circumstances; sometimes, as in the case of shad or salmon, the number obtainable will be sufficient to occupy all the attention that can be devoted to them; at others, the run of spawning fish is greatly diminished by local conditions, such as the temperature, the height or the turbidity of the water, artificial obstruction, etc., and much disappointment ensues. Gradually, however, with the increasing experience of the assistants of the Commission, a better knowledge of the times and seasons of the fish, improved apparatus, and the extension of the number of stations, the difficulty has been overcome; and it is now quite possible to calculate with considerable precision the result to be expected for any given year from a certain appropriation.

At present the applications are increasing in a much greater ratio than the amount of the appropriations and the actual facilities for securing the eggs. The Commission endeavors to make the distribution as equitable as possible, so that no one portion of the country shall appear to be favored at the expense of another, but a certain amount of disappointment is sometimes expressed at the failure to introduce the fish at some particular point designated, when the deposit has actually been made in the same waters nearer their source. It is not generally understood that the greater amount of runway between the place of deposit and the Gulf of Mexico or the ocean the better it is for the fish, as in the upper portion of the stream the water is generally cooler and more free from destructive fishes that would act unfavorably upon the fry after introduction.

In the Mississippi Valley the inhabitants on the Lower Ohio are benefited by the introduction of fish into the headwaters of its tributaries, and those in the Lower Mississippi receive the advantage of all the distribution to points on any stream that discharges its contents into the "Father of Waters."

The citizens of Massachusetts and Connecticut are better served by the planting of salmon or shad in waters of the Connecticut River in the States of Vermont or New Hampshire than they would be if these were placed within their own States.

As will be seen in a subsequent portion of this report, applications for the assistance of the United States Fish Commission have not been confined to the United States, a number of calls having been received from Australia, New Zealand, the Sandwich Islands, Germany and elsewhere. These have been met, so far as it could be done without crippling the home distribution; in most cases the actual expenses have been refunded, thus affording the means of extending operations in proportion.

A special object in encouraging or superintending the transmission of eggs or young fish to foreign countries has been the desire to secure the information necessary to bring back in return new varieties of useful food-fishes for introduction into American waters.

Distribution of eggs and of young fish.—The operations of the United States Fish Commission have thus far been confined almost entirely to the anadromous species, or those which, although born in the upper waters of rivers, receive there but a small portion of their growth, and after a few months' sojourn descend to the ocean, and there remaining until reaching full maturity; this in most cases requiring a period of about four years. After this they return to their starting point, solely for the purpose of reproduction, and scarcely ever taking any food during this period.

The propagation and distribution of such species as trout, black bass, perch, etc., have been left to the State commissions, as more especially appropriate to them, these fish being local in their habits, living the year round in or near the same spot, and depending for food upon what they can catch around them.

The principal work of the United States Commission has been connected with the Atlantic salmon, *Salmo salar;* the Landlocked salmon, a variety of the same species, localized in ponds or lakes; the California salmon, *Salmo quinnat*, and the shad, *Alosa sapidissima.* Something has been done with the whitefish, *Coregonus albus*, but less than would be necessary if this were not a favorite subject of attention on the part of certain States. The introduction of the European carp has also been a matter of attention by the Commission.

Relation to the Fish Culturists' Association.—The American Fish Culturists Association is an organization which has also performed a large part of the work of progress referred to, its annual meetings, begun in 1871, and continued since, invoking the presence of a large number of experts in fish culture, as well as of many members of State fish commissions, and giving an opportunity for the interchange of ideas and suggestions, and of forming personal acquaintances between those who are endeavoring to promote the common object. It must not be forgotten that the first authoritative suggestion of the propriety and importance of Federal action in regard to the stocking of the common waters of the United States was made by this body, a committee having been appointed at the meeting of 1871 to memorialize Congress on the subject, as mentioned in the previous portion of the report. The

valuable counsel and advice of the officers and members of this association have always been at the service of the United States Commissioner, and have been made use of in many important instances.

Relation to State fish commissions.—The rapidly-increasing interest in the subject of fish culture and the appreciation of the benefits it is likely to render to the country at large is shown by the increasing number of State fish commissions appointed since the commencement of fish-breeding operations by the United States. In 1871 the whole number of State commissions in actual operation consisted only of those of Maine, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, and California. At the present time, however, no fewer than twenty States are provided with such officers; and while some have but a small amount of money at their disposal others have had placed at their command a supply more or less adequate to their needs.

At their request the United States Commissioner had for several years past called meetings of the State Fish commissioners. In 1874 and 1875 these were held at the same time with the annual February meeting in New York of the American Fish Culturists' Association. At the meeting of 1875, however, it was proposed that the convention for 1876 should be held at Philadelphia during the Centennial Exhibition; and this took place on the 5th of October, and was attended by nineteen commissioners from ten States. Mr. Theodore Lyman, of the Massachusetts commission, presided.

A special subject of consideration at this meeting was the propriety and character of inter-State legislation on the subject of fish and the fisheries, and the relations of the general government to the common waters or to the high seas. A paper on this subject was read by Mr. Milner, the Assistant United States Commissioner, which was approved by the convention. This communication, then in an imperfect and unfinished condition, will soon be presented for publication.

The methods and plans of the United States Commission in stocking the waters of the United States were entirely approved, and their continuance on as large a scale as the funds would permit was recommended. Attention was especially directed to the impossibility of securing proper action by the States alone in increasing the supply of important fish, which was illustrated by the fact that should Ohio undertake to introduce salmon or shad into her waters at her own expense the fish, necessarily descending to the Gulf of Mexico in order to receive their full growth, would return along the borders of or through a large number of States before they could reach the waters from which they started, those actually accomplishing this feat being but a small fraction of the original number.

The States nearer the Gulf of Mexico, again, would not find in the Mississippi a suitable place for the deposit of the young fish, and consequently any effort or expenditure that might be made would be neutralized. When, however, the work is done by the general government,

it is a matter of comparative indifference where the fish are captured, so that they are developed and made available for the needs of the country. At whatever point taken, they will find a market wherever there is the greatest demand for them, and the country at large be benefited.

The mutual relations of the States were considered to refer more especially to the question of the protection of the fish introduced either by themselves or by the United States Commission, a system of forbearance and harmonious action being necessary in order that all may be properly benefited. This is especially necessary where a river runs successively through two or more States, as the Connecticut. Whatever be the amount of effort or expenditure in regard to the propagation of fish made by the States on the upper tributaries of that river, all might be entirely neutralized by a neglect on the part of the State of Connecticut to prevent such a practice of fishing as to season and extent, as would cut off more or less completely the ascent of the fish above her territorial limits.

Another subject of consideration by the convention was the hybridizing of fish, with a view of removing the instinct of migration, and by the atrophy of the sexual apparatus, allowing a more rapid accession of flesh and of fat, as is the case with hybrids and castrated domestic animals.

The convention adjourned, after a harmonious session, to meet, subject to the call of the United States Commissioner, at Chicago, in October, 1877.

The necessity of aid to the State Fish-hatching establishment is shown by the fact that, as a general principle, the expense to any one or even two States involved in the erection of a suitable hatching-establishment for salmon, and in obtaining their eggs, as well as the difficulty of finding outside their own limits a legitimate and proper scene of operations is an effectual obstacle; and even were it possible to overcome this difficulty, the funds would all be exhausted in the production of the eggs, leaving nothing for their subsequent hatching out and ultimate distribution. By the present method the entire cost is borne by the appropriation for the United States Commission, and the eggs are supplied as far as possible in such numbers as may be asked for by the several State commissioners, who meet the cost of their transportation from the hatching-station, their development, and their subsequent introduction into the waters, the result being a harmony of action and concurrent working toward a common end.

In some instances States more particularly interested have contributed to the cost of obtaining the eggs, for which they received a *pro rata* return from the United States Commission. Thus, Massachusetts, Connecticut, and Maine have assisted in the production of the salmon eggs in the last-mentioned State, while the State of California furnished a liberal appropriation toward the expense of operations in the Sacramento River.

The work of the hatching of shad on the Connecticut River has been prosecuted with the moral co-operation and support of the fish commissioners of Connecticut and Massachusetts, although no funds have been contributed by them. In the hatching of shad in the Susquehanna, very effective and important assistance has been experienced from Mr. Ferguson, commissioner of Maryland.

Inter-State relations and co-operation.—A very satisfactory feeling has been manifested by the commissioners of adjacent States in regard to mutual co-operation. The New England commissioners have for several years past had annual meetings for the exchange of experiences and for the promotion of the cause which they represent, all action in reference to the fisheries of the Connecticut being decided upon by the commissioners of Connecticut, Massachusetts, Vermont, and New Hampshire, and all relating to the Merrimack, by those of Massachusetts and New Hampshire.

The commissions of several adjacent Western States have also maintained a similar relation to each other. In not a few instances the eggs destined for States without State commissioners or without State hatching establishments have been hatched out for them by their more fortunate neighbors.

Relation to the Government bureaus.—For the purpose of facilitating the operations of the Commission in the hatching of shad in the Potomac River, Captain Patterson, Superintendent of the United States Coast Survey, had special tables prepared of the variations of the tide in the Potomac River for the months of March, April, May, and June, 1875 and 1876. These were found to be of great service.

Relation of United States and State Commissions to private individuals.—Private means have in a few instances been used disinterestedly for public purposes, well illustrating the existence of a generous appreciation of the work and the great faith entertained in its ultimate results. A noteworthy instance of public spirit in advancing a common interest has been exhibited by Mr. N. K. Fairbank, of Chicago, who has expended several thousand dollars in stocking with fishes to its utmost capacity Geneva Lake, a body of water in Southeastern Wisconsin, spring-fed, deep, and remarkably full of invertebrate life, and with an area of from 10,000 to 11,000 acres. His object was to determine "as soon as possible, by planting a very large number of fish in a lake perfectly adapted by nature—so far as any small fresh-water lake can be—the practicability of stocking small lakes with the better varieties of food-fishes."

In the appended table is given the number of young fishes introduced into this lake in 1875 and 1876, the two years during which Mr. Fairbank has continued his enterprise. The California salmon and the land-locked salmon were furnished by the United States Commission.

Table of the number of young fishes put into Geneva Lake, Wisconsin.

Fishes.	1875.	1876.	Total.
Brook-trout	50,000	150,000	200,000
Salmon-trout	250,000	750,000	1,000,000
Land-locked salmon	10,000	10,000	20,000
California salmon	25,000	50,000 *15,000	90,000
White-fish	100,000 *15,000	750,000	865,000
Wall-eyed pike		1,500,000	1,500,000
Total			3,675,000

*Furnished by the State of Wisconsin.

For the better accomplishment of his object, Mr. Fairbank erected a hatching-house, and provided it with an expert, and expects to enlarge, if possible, his work in the ensuing year.

In 1875, Ex-Governor Leland Stanford contributed $1,000 to meet the expense of introducing 1,000,000 fry of the California salmon in the Sacramento River.

Dr. Capehart, of Avoca, N. C., at the mouth of the Chowan, and Mr. Wood, residing near the same place, expended about $650 in hatching shad for the benefit of the fisheries of Albemarle Sound.

Public acknowledgment is due to Mr. E. A. Brackett, one of the fish commissioners of Massachusetts, who, through Mr. Frederick Curtis, his attorney, formally presented to the United States Fish Commission the free and perpetual use of the well-known Brackett hatching-box. This apparatus is specially intended for the hatching of eggs of shad and other fish, in running water, and under the same conditions and circumstances as that of Mr. Green, which it replaces very satisfactorily. An illustration of this invention will be found on page 579 of the Report of the Fish Commission of 1872–'73.

Relations to foreign countries.—As properly befitting a national enterprise, the United States Fish Commission has maintained a hearty co-operation with similar organizations abroad, and it is hoped with mutual benefit. The Deutsche Fischerei-Verein of Germany is a very important body, composed of some of the most prominent men of the nation, and having under its supervision the collection of fishery statistics, the investigation of the fisheries, and the propagation of fish on the part of the state. As might be expected from so enlightened an association, the greatest interest has been manifested by it in improvements in fish culture on the part of the United States, and at the request of Mr. Von Behr-Schmoldow, a member of the Verein, a set of American apparatus, of full size or in working models, was prepared by direction of the United States Commission, and transmitted to Berlin, where it excited much attention.

The result of an application to the United States Commissioner for information and statistics has been made the subject of special meetings, at which much reliable information was elicited. An account of these

proceedings, translated from the circulars of the Verein, will be found in the Appendix.

Mr. R. Eckhardt, proprietor of the fish establishment of Lubbinchen, near Güben, Silesia, presented 1,000 eggs of the "Madüe Maræna," a white-fish (*Coregonus maræna*, Bloch). This species is said to be found only in a few lakes in provinces of Pomerania, Brandenburg, and Holstein, of which the Madüe Lake is the most important. The eggs were shipped by the Bremen steamer the end of January, 1877, and on arrival were repacked and transmitted to Mr. Oren M. Chase, the director of the Michigan State Hatching-House at Detroit. The fish appeared in the latter part of March, and 409 of them were successfully placed in a deep lake in Otsego County, Michigan, known as Gardner's Lake, where no white fishes had been previously introduced, and which was believed to contain no predaceous species. The result of this experiment of introducing a European food-fish will be looked forward to with great interest.

Japan has in no degree been behind European countries in its desire for information as to the best methods of inproving the fisheries and multiplying fish within her borders; and Mr. Sekizawa Akekio, one of the Japanese commissioners to the Philadelphia International Exhibition, devoted the greater part of his time in this country to the investigation. He not only spent a considerable time in various hatching establishments, but visited some of the sea-ports of the country, and made a fishing voyage for the purpose of studying this branch of American industry. At his request a full series of models of the more important fish-hatching apparatus and the best forms of fishways was furnished in exchange for the contribution of the entire fisheries exhibit of Japan, a collection of very great practical and ethnological value.*

The Canadian commission of fisheries, through Mr. Samuel Wilmot, presented 6,000 of the Ontario salmon eggs, *Salmo salar*, Lin., which were placed at the command of the New York commissioners, and hatched at the New York aquarium under their direction. From these 4,500 young fishes were obtained and deposited in Otsego Lake, at Cooperstown, N. Y., in June, 1877.

From the railway department of the department of public works,

* The list of apparatus given to Mr. H. Kubo, one of the commissioners for Japan, contains the following articles:

One Ferguson's hatching-jar.
One Coste hatching-box of glass grilles.
One Stone's salmon-hatching box.
One model Brackett's hatching-box.
One model Green's shad-hatching box.
One model Brackett's fishway.
One model Foster's fishway.
One model Eveleth's fishway.
One model Swazey's fishway.
One model Swazey & Atkins's fishway.
One model adaptation of Foster's fishway.

Canada, through W. F. Whitcher, esq., of the fisheries department of Canada, facilities were offered for the transportation of fishes on the Canadian railways, and from the same gentleman a permit was granted to Mr. James W. Milner, of the United States Fish Commission, to collect fishes in Lake Simcoe for scientific purposes.

Reference has already been made to the donation at the close of the Centennial of the fishery exhibits of several countries, as Norway, Sweden, Spain, the Philippine Islands, Portugal, Japan, China, etc.

Facilities extended by railroad companies.—The general appreciation of the objects of the Commission has been satisfactorily exhibited in the facilities given by various railroad companies to the messengers engaged in the transportation and planting of young fish in American waters. With very few exceptions all whose services have been required have carried the cans containing the young fish without any charge for extra baggage, and, what is of more importance, have permitted the fish to be taken in express-trains, and to be visited by the messengers accompanying them, at such times as were necessary, for the purpose of giving them the requisite attention. The free transportation of the messengers themselves has not been asked for nor expected, the facilities mentioned being of much more importance and having an absolute relation to the success that has been experienced in the work.

Appended herewith is the circular authorized, with occasional special slight modifications, by the companies named in the accompanying list. A few railroads only have refused co-operation in this action, on the ground that they can make no exceptions to their general rules. Even here, although the charges for extra baggage have been collected, the desired facilities to attendants have been granted.

"THE LAKE SHORE AND
"MICHIGAN SOUTHERN RAILWAY CO.,
"GENERAL SUPERINTENDENT'S OFFICE,
"*Cleveland, O., March* 15, 1876.

"*To Conductors and Baggage-masters:*

Upon presentation of this order, duly countersigned by Spencer F. Baird, United States Commissioner of Fish and Fisheries, you will transport free, until March 1, 1877, cans of young fish in baggage-cars of passenger-trains.

"You will also render every assistance desired by messengers in charge of fish and allow them access to baggage-cars for the purpose of taking care of the fish.

"Conductors will honor government orders, when properly receipted, for transportation of agent or messengers of the Commission; but in absence thereof a first-class ticket or fare must be collected. If the government order extends to a point beyond this railway, you will have it properly receipted, take it up and procure for the bearer a through

ticket to the point named in the order, at the first station where such ticket can be obtained.

Facilities of express companies.—At one time some inconvenience was experienced in consequence of the agents of the Southern Express Company insisting that, under contracts with the several southern railroads, they were entitled to the right to transfer the cans of young fish to their cars, and to charge freight for the same, while at the same time under their rules messengers were refused permission to accompany them. This resulted on one or two occasions in the entire loss of the shipment of fish; but on presenting the case to the president of the company, he, with great liberality, issued the following order, which answered its purpose perfectly; since which time there has been no further trouble of the kind.

"SOUTHERN EXPRESS COMPANY,
"SUPERINTENDENT'S OFFICE,
"*New Orleans, March* 23, 1875.

"DEAR SIR: Your favor of 11th March, to Mr. Shoemaker of the Adams Express Company, complaining of the arrangements between it and the various railroads south, whereby matter of freight is not permitted to be taken on the passenger-trains except in charge of the messengers of the Southern Express Company, and that it greatly interferes with your purpose of stocking the southern and southwestern Rivers with fish, is before me.

"In response I have to say that it is the desire of this company to aid in that work as far as possible, and for that reason it will waive any right it may have under its contracts with various railroad companies, leaving the agents and messengers of your departments free to send their cans or tanks of fish in any way or manner you may desire, which shall be agreeable to the management of the various railway companies.

"The agents and messengers of this company are hereby instructed not to claim or interfere with the transit of your matter in question in any manner you may select.

"Respectfully, &c.,

"H. B. PLANT,
"*President.*

"*Washington, D. C.*"

5.—ACTUAL WORK OF PROPAGATION OF FOOD-FISHES IN 1875 AND 1876.

The Shad-Season of 1876.

The Potomac station.—In previous years several attempts were made to obtain and hatch the eggs of shad in Southern rivers, especially in the Savannah and the Roanoke. In consequence of their failure to accomplish results at all proportionate to the expense, it was determined to begin the work of 1876 in the Potomac, where, as subsequently in the Susquehanna, the work was prosecuted by Mr. Milner, in co-operation with Mr. T. B. Ferguson, the fish commissioner of Maryland.

On the 8th of May a camp was established at Ferry Landing, near Mount Vernon, and Mr. Frank N. Clark placed in charge. It was not until the 13th of the month that any ripe fishes were found. The steamer Lookout, belonging to the Maryland commission, was kept in constant communication with other fishing stations near by; and as the result of the operations, continuing until the 24th, about 686,000 young fish were hatched, of which 100,000 were shipped to North Carolina, and the remainder placed in the Potomac River.

A larger number of young shad would have been secured but for the loss involved in the upsetting of the hatching-boxes in consequence of high winds, the great width of the river rendering it impossible to prevent loss by such accidents. A boom of logs was kept anchored near the boxes for their protection, but this was not always sufficient.

The shad-seines on the Potomac stopped work on the 23d of May with a decided loss to the proprietors, showing conclusively that the serious diminution in the abundance of shad and herring already referred to has continued.

The Susquehanna River station.—A second series of stations, six in number, for the hatching of shad, had been started by Mr. Ferguson at the mouth of the Susquehanna, near Havre de Grace, on the 9th of May; and for some time before the camp was broken up at Ferry Landing, a large number of young shad had been hatched out and turned into the river. On this river, as on the Potomac, the active work of securing the eggs and of hatching them out, as also of the distribution of the young fish to Maryland waters, was conducted by Mr. Ferguson. Their shipment and transportation to points outside of that State was under the direction of Mr. James W. Milner, assistant United States commissioner.

The total fish-production of the several stations on the Susquehanna, at the head of Chesapeake Bay, was 3,741,000 fish, of which 2,143,000 were turned into the waters of Maryland and 1,597,500 shipped elsewhere.

An unusual scarcity of ripe males in the Susquehanna during the season largely reduced the total yield of fertile eggs. A large number of the shad were obtained from the drift, or gill-nets, which required to be carefully watched, and the ripe fish removed while still alive. In

this mode of fishing the eels were found to be very destructive, half of the catch, as thrown into the boats, frequently consisting of heads and back-bones of shad from which the flesh had been stripped by the eels.

The catch of fish in the Susquehanna by the seines and nets, although much greater than that in the Potomac, was still vastly less than in former years. Mr. Milner learned from residents of Havre de Grace that in May of 1837, at a single haul of a thousand-fathom seine, 1,350,000 herring were taken (representing 2,700 barrels), and many thousands of shad.

The Connecticut River station.—This station was established on the 3d of July, Mr. Milner placing Dr. A. D. Hagar in special charge of the production of the fish. The first eggs were taken on the date mentioned; but the number was greatly lessened by the unprecedented warmth of the water, this registering 83° on the 3d of July and reaching 86° by the 20th of the month, a temperature at which the eggs of the shad failed to develop, being, apparently, killed even in the ovary of the parent. A heavy rain about the 24th raised the river and reduced the temperature to 76°. Soon the hauling was again begun and continued until the 5th of August.

The total yield was 1,958,000 young fish, of which over three-fourths were returned to the Connecticut. Distant shipments were made to the Alabama, the Sacramento, and the Mississippi Rivers.

The entire season's work at the three stations resulted in the introduction into suitable waters of 5,877,500 shad. The details of distribution, places of deposit, &c., will be found in the accompanying tables.

The California Salmon.

Columbia River station in 1875.—The abundance of salmon of several species in the Columbia River has long attracted astonishment and admiration, the fish entering that river in such enormous numbers every year as to make the possibility of its exhaustion appear entirely improbable. It is only within comparatively a few years that any attempt has been made to utilize them on a large scale, this being done by salting and pickling in barrels, and subsequently by putting them up in cans as fresh fish. This latter industry, as being more profitable, is now the leading one, and the disproportion between the canned and pickled fish increases every year.

The belief in the inexhaustibility of the salmon in the Columbia received a severe shock when it was found that the actual catch during a given year was appreciably less than the preceding. This was at first supposed to be accidental; but when the decrease was found to continue, the canners took the alarm and, fully aware of the danger, memorialized Congress for some legislation that should restrict the unlimited taking of the fish and be accompanied, if possible, by some provision for artificial propagation. The memorial was referred to the

Committee on Commerce of the Senate, and the opinion of the United States Commissioner of Fish and Fisheries asked in regard to it. His reply will be found at length in the Appendix. It takes the ground that the question of jurisdiction over the waters of the Columbia River, dividing the State of Oregon from the Territory of Washington, was possibly not in the United States, and at any rate, until it had been so declared, it would be inexpedient for the General Government to attempt any special matter of regulation. It was, however, suggested that by the erection of a suitable hatching establishment on the river, any waste from excessive fishing might be more than made up by the increased number of young fish turned into the waters.

For the purpose of being prepared to act in the latter direction, should Congress so direct, Mr. Livingston Stone, who has been, since 1872, in charge of the hatching of salmon on the Pacific coast for the United States Fish Commission, was instructed to proceed to the Columbia River and make a careful investigation of the whole question of abundance and of supposed decrease, and to select such station or stations as might in the future be established for the purpose of artificial propagation. He was also directed to make full collections in alcohol of the salmonidæ of the Columbia River, so as to determine the question as to whether the California salmon is found in the Columbia also.

On the 6th of May, 1875, Mr. Stone reached Portland on his mission and occupied several weeks in its prosecution. From his report, which will be found in the Appendix to the present volume, it will be seen that he recognizes the fact of the reduction in abundance, the danger of future exhaustion of the fishery and the destruction of the canning interest, and the necessity of proper measures both of legislation and of fish culture to arrest the impending evil. He selected one or more stations, which he judged would be suited to the purpose, and made extensive collections, from which it is ascertained that the most important species of the Columbia is the *Salmo quinnat*, the same as that of the Sacramento, and that the total number of species is much less than had been imagined, the fall or spent fish of several kinds being considered by the fishermen and residents along the river as distinct species.

Mr. Stone was everywhere received with great cordiality, all the business men of the region fully appreciating the importance of his mission, and rendering all the aid in their power in performing it.

The McCloud River station in 1875.—The geographical position and general character of the McCloud River salmon-hatching station has been indicated in previous reports. It is situated on the western or right bank of the McCloud River, about two miles above its entrance into the Pitt, a tributary of the Upper Sacramento. It is in the immediate vicinity of Mount Shasta, and on the high-road from Redding, California to Oregon, stages passing it daily. The work of salmon propagation here was first entered upon by Mr. Livingston Stone in 1872, beginning on a small scale, and with the extension of the buildings

and apparatus enlarging each year. So far, it has proved capable of furnishing a very large number of eggs of the salmon; and, indeed, it is possible that as many as 20,000,000 of eggs could be obtained annually, by the expenditure of sufficient funds. The total production, however, is circumscribed by the appropriation for the purpose, and has usually been kept within a limit of from eight to ten millions.

For a time the station was occupied during the summer only, being abandoned in the winter; to be resumed again the following year. Finding it in danger of being "jumped", or squatted upon, arrangements were made for continued occupation, and the establishment is throughout the year in charge of Mr. Myron Green, an assistant of Mr. Stone in his labors.

Although the land covered by the fishery was not opened for market, the possibility that this might take place at an early date, suggested the idea of having the fishing station proclaimed a government reservation, and the Commissioner of the General Land Office, advising the Secretary of the Interior that there was no impediment in the way, the President made the reservation by proclamation on the 9th of December, 1875. A claim had, however, been made by Mr. Lezchinsky, of prior rights in the way of having established a salmon fishery in the grounds in 1872, a few months before its occupation by Mr. Stone. His claim, which was duly filed, was considered by the Attorney-General and declared to be unfounded, the United States having the right to entire control. The correspondence connected with the establishment of this reservation, and with the claims of Mr. Lezchinsky, will be found in the appendix.

The operations connected with the taking of salmon on the McCloud in 1875 were commenced by Mr. Stone on the 16th of June, and closed on the 20th of October. The first eggs were obtained on the 2d of September, and between that time and the 27th, 8,629,000 were secured, making a bulk of over one hundred bushels, and weighing when packed over ten tons.

As usual, a circular was sent to the various State commissioners, asking how many eggs they desired to secure, with the understanding that they were to pay the expense of transportation to their hatching establishments and of planting the young fish in public waters. The officers of sixteen States responded, calling in many cases for more eggs than a fair *pro rata* would permit, the number supplied to each, however, varying from 10,000 to 500,000.

One million of these eggs were sent to the hatching establishment of Mr. N. W. Clark, at Northville, Mich., to be hatched out on account of the United States Fish Commission, for distribution to such States as were not provided with commissioners. Several private establishments were supplied with small lots for experimental purposes, and a small stock was also sent to New Zealand and to the fishery department of Canada. The greater part of the eggs reached their respective destina-

tions in excellent condition, and the young fish were in due time introduced into waters covering a wide range of locality.

The fish commissioners of California, fully alive to the importance of maintaining the fisheries in the Sacramento River, both for the purpose of securing eggs and for the propagation of fishes for food, furnished the means for meeting the additional expense of hatching and introducing many young salmon into the Sacramento River.

The McCloud River station, 1876.—In 1876 the station was opened and in operation from the 1st of July to the 20th of October. The first eggs were taken on the 22d of August, and the last on the 17th of September, showing that the season was somewhat earlier than that of 1875. The number of eggs secured was 7,498,500; the greatest number taken in one day being 986,150. Up to the year 1876, the eggs had been shipped to their respective points of destination by express, each transmission being isolated and distinct, the consignee paying the freight charges. After careful consideration Mr. Stone advised that all the eastern shipments of eggs in 1876 should be made in bulk as far as Chicago, and that a special car should be secured and properly fitted up, in which the eggs should be placed and transferred on an express train in the care of proper messengers. This experiment was carried out and proved an entire success, eighteen consignees in thirteen States receiving their supplies in even better condition than usual, and at less expense. Some additional shipments were made, in October, of a later run of fish.

In addition to the many applications from the United States, calls had been received from other portions of the globe, and especially from the governments of Australia and New Zealand, and from parties in the Sandwich Islands, for a supply of impregnated eggs of California salmon, believing that this species would thrive as well in those countries as in North America. Desirous of meeting these applications in a friendly spirit, and as an act of international courtesy, the applicants were informed that the eggs would be furnished if the actual expenses consequent upon the packing and transportation were refunded, which offer was gladly accepted, and a consignment of 80,000 eggs each made to the colonies of Wellington, Hawke's Bay, Canterbury, and Maryanna, in New Zealand, and to the Sandwich Islands. The experiment was entirely successful, the eggs reaching their destination and being introduced into the waters with but a slight percentage of loss. In the appendix will be found the correspondence with the New Zealand authorities on this subject, and a report of the results.

As in the previous year, eggs of a later run of salmon were hatched in behalf of the State of California, and 1,500,000 young fish turned into the river. The expense of this was borne by Messrs. Crocker and Stanford, of San Francisco.

The Atlantic Salmon in 1876.

Nothing was done during the years 1875 and 1876 in connection with the Atlantic Salmon, although the establishment at Bucksport was maintained in a condition of proper efficiency, under the direction of Mr. Charles G. Atkins. This work had been carried on with the co-operation of the States of Connecticut and Massachusetts, and the United States Commissioner concurred with the commissioners of those States in the propriety of discontinuing effort until the results of the labors of the several preceding years had been determined.

The Landlocked Salmon.

Instead of co-operating, as heretofore, in the propagation of the sea or Atlantic Salmon, it was decided by the United States Commissioner, in conjunction with the commissioners of Connecticut and Massachusetts, to experiment upon the Landlocked Salmon, a fish at one time thought to be a distinct species, but now pretty well established as being really a landlocked sea salmon, or, in other words, a *Salmo salar*, which, for some reason, has remained in the fresh waters instead of going to the sea, and by restriction in run has been reduced in size, while maintaining all the characteristics of its larger relative as to flesh and attractiveness to the angler. This fish is found in a number of lakes in Maine, especially the Sebago, the Sebec, and Reed's Ponds, and the lakes connected with the Saint Croix in Maine and New Brunswick. A similar variety occurs also in numerous waters in New Brunswick and Nova Scotia, and also in the vicinity of the Gulf of Saint Lawrence and the lower portions of the river. The fish varies in size from that of the Sebago Ponds, which sometimes reaches ten or fifteen pounds, to that of the Grand Lake Stream, where one of three pounds is quite an unusual maximum.

The first experiment in regard to the Landlocked Salmon made by the United States Fish Commissioner, in conjunction with the commissioners of Connecticut and Massachusetts, was in 1873, at Sebec Lake, where, under the direction of Mr. H. L. Leonard, the necessary works were erected. This was the first formal effort in the direction of reproducing the Landlocked Salmon, although experiments on a small scale had been made previously by private parties. The results of the first year's operations at Sebec were not very satisfactory, only 24,000 eggs being obtained, which were divided between the United States Commission and the commissioners of Massachusetts, Rhode Island, and Connecticut.

A second season of experiment at Sebec in 1874 was not more satisfactory, and it was concluded to transfer the seat of operations in 1875 to Grand Lake Stream. This is connected with Grand Lake, one of the series of ponds tributary to the Saint Croix River, within a comparatively short distance of the village of Calais, in Maine. The necessary arrangements having been made with Messrs. Shaw, the proprietors

of the land, by Mr. Charles G. Atkins, the assistant in charge, the work was begun under the joint auspices of the United States Fish Commission and those of Massachusetts and Connecticut. Maine participated in the benefits of the enterprise, under the State law which requires one-fourth of all the eggs taken from fish within her borders during the close season to be hatched out and turned into the waters.

Between the dates of October 25 and November 25, 1,055 males and 1,571 females were secured and impounded. From these 1,077,500 eggs were taken and impregnated, of which 668,500 were distributed to the subscribers *pro rata*, in February and March, 1876; while 265,000 were introduced into Grand Lake Stream, on account of the State of Maine.

The operations during the year 1876 were continued under the same general principles and at the same locality as in 1875, the eggs being sufficiently ripe to be taken on the 6th of November, and the season lasting until the 22d of November, 530,000 eggs being obtained from 272 males and 749 females; and 12,500 eggs in addition were obtained from adjacent waters. Owing to various causes beyond the control of Mr. Atkins a number of the eggs secured proved unproductive, and only 460,000 serviceable eggs were distributed. Of these 145,000 were sent out by the United States Commissioner, 200,000 by Massachusetts and Connecticut, and 115,000 were placed in Grand Lake Stream. The commissioners of the States mentioned, as usual, received the eggs, and after hatching them out distributed them to localities within their own borders. The distribution on the part of the United States Commission will be found in the tables in the appendix of the present report.

The Whitefish.

There is no species of American food-fish superior in economical importance to the whitefish, and its multiplication in localities especially favorable to its growth is deserving of the utmost effort. It is to this species especially that the attention of the State commissions bordering on the great lakes has been particularly drawn, those of Ohio, Michigan, Wisconsin, and of Canada, being alive to its importance. The utmost effort has been put forth to secure an abundant supply of eggs, and after hatching them out to introduce the young fish into adjacent waters, the total expenditure by the States in this direction being nearly equal to the appropriation for the United States Commission.

The fact that the States are so active in this direction has rendered it less necessary for the United States Fish Commission to take any special action in the matter. Its efforts have therefore been confined merely to securing a sufficient supply for distribution to appropriate localities outside of the region of production, especially to the State of California, where there are numerous lakes suited to the growth of this fish, and which are now destitute of anything corresponding to the genuine whitefish, *Coregonus albus*.

Arrangements have usually been made either with the States or with

some private hatching establishment, as that of Mr. N. W. Clark, at Northville, to collect for the United States Fish Commission and bring forward a certain number of these eggs; and for several years past shipments have been made to California, as just mentioned.

In December, 1876, 250,000 eggs were sent to Mr. B. B. Redding, the California fish commissioner, from the establishment of Mr. Clark, and reached their destination in good condition; the whole number to California amounting to 720,000. A considerable number of eggs was also sent to New Zealand, at the request of the government, a portion of which arrived in good order and have been successfully hatched out. One hundred thousand impregnated eggs were also sent to the Indian reservation near Keshena, in Wisconsin.

After the stock of eggs was collected in 1876 on account of the United States Commission at Mr. Clark's establishment at Northville, it was found that the appropriation was not sufficient to meet the cost of shipping these eggs to various localities which had been selected for the purpose, and a supply was therefore placed at the command of the fish commissioners of Michigan, by whom 300,000 were planted in Lake Erie and 1,507,000 in the inland lakes of Michigan.

The Carp.

The history of operations relative to the introduction of carp into the United States will be given in the next report. An account of the fish itself, with the methods of its culture, by Mr. Rudolf Hessel, will be found in the appendix.

I.—*Table of hatching and distribution of shad by the United States Fish Commission.*

APPENDIX A.

SEA FISHERIES.

(THE AMERICAN WHALE FISHERIES.)

I.—HISTORY OF THE AMERICAN WHALE FISHERY FROM ITS EARLIEST INCEPTION TO THE YEAR 1876.*

By Alexander Starbuck.

A.—INTRODUCTION.

Few interests have exerted a more marked influence upon the history of the United States than that of the fisheries. Aside from the value they have had in a commercial point of view, they have always been found to be the nurseries of a hardy, daring, and indefatigable race of seamen, such as scarcely any other pursuit could have trained. The pioneers of the sea, whalemen were the advance guard, the forlorn hope of civilization. Exploring expeditions followed after to glean where they had reaped. In the frozen seas of the north and the south, their keels plowed to the extreme limit of navigation, and between the tropics

*More than fifty years ago (in 1825) Samuel H. Jenks, esq., then editor of the Nantucket Inquirer, announced his intention to write the history of whaling, and advertised for material for that purpose, but so little encouragement did he meet, so little material came to hand, that he finally abandoned the design in despair of ever being able to satisfactorily complete it.

In the preface to his admirable Report on the Fisheries, published in 1852, Hon. Lorenzo Sabine says: "More than twenty years have elapsed since I formed the design of writing a work on the American fisheries, and commenced collecting materials for the purpose. My intention embraced the whale-fishery of our flag in distant seas. But increasing cares prevented the consummation of his plans.

The difficulties in the way of collection of historical notes increase greatly with the lapse of years. Newspapers, which must always be considered, where they exist, invaluable aids in the prosecution of such matters, pass from the possession of the very few who, when living, treasured them, and fall into the hands of those who only value them at so many cents per pound. Those who were the actors in the scenes which it is desired to describe die, and with them perishes the source of the information, which ultimately, in the form of tradition, becomes too distorted to be available. In the matter of the whale-fishery still another formidable difficulty is met with, in the absence or destruction of customs-records. During the Revolution many ports were under English control, and very often with the departure of the British also departed the custom-house papers. In other ports, notably New Bedford and Nantucket, these records have been destroyed by fire. Still again in yet other ports, notably Sag Harbor, mildew and decay have obliterated the writing.

About eighteen months ago Prof. Spencer F. Baird, United States Commissioner of Fish and Fisheries, requested the writer to prepare a historical sketch of this indus-

they pursued their prey through regions never before traversed by the vessels of a civilized community. Holding their lives in their hands, as it were, whether they harpooned the leviathan in the deep, or put into some hitherto unknown port for supplies, no extreme of heat or cold could daunt them, no thought of danger hold them in check. Their lives have ever been one continual round of hair-breadth escapes, in which the risk was alike shared by officers and men. No shirk could find an opportunity to indulge his shirking, no coward a chance to display his cowardice, and in their hazardous life incompetents were speedily weeded out. Many a tale of danger and toil and suffering, startling, severe, and horrible, has illumined the pages of the history of this pursuit, and scarce any, even the humblest of these hardy mariners, but can, from his own experience, narrate truths stranger than fiction. In many ports, among hundreds of islands, on many seas the flag of the country from which they sailed was first displayed from the mast-head of a whale ship. Pursuing their avocation wherever a chance presented, the American flag was first unfurled in an English port from the deck of one American whaleman, and the ports of the western coast of South America first beheld the Stars and Stripes shown as the standard of another. It may be safely alleged that but for them the western

try, so far as it related to our own country, and append to it, so far as was practicable, a record of every voyage which has been performed. Of the magnitude of this labor only those who have had similar experience can form any idea. In the one item of marine reports, it comprehended the examination of newspapers covering a period of one hundred and seventy years. The limited time allowed for the work performed is not mentioned by the writer in any spirit of self-laudation, but as a statement due to himself for any possible errors of omission or commission that may have occurred.

Fortunately in the collection of material for a work of an entirely different nature much had been gathered which had a bearing upon this subject, and much that was absolutely necessary for use in this connection, and, fortunately, the kindness of many friends lightened still more the labor. Wherever the writer has been in search of material the utmost courtesy has been extended, and, with very rare exceptions, whenever application has been made, books and documents have been freely placed at his command. Especially is he under obligations to Charles Eldridge, esq., of Fairhaven; Dennis Wood, esq., the proprietor of the Shipping-List; and R. C. Ingraham, esq., of New Bedford; the late William R. Sleight, esq., of Sag Harbor, N. Y.; the late Hon. Henry P. Haven, and Haven, Williams & Co., of New London, Conn.; Benjamin F. Cook, esq., of New York; Hon. Lorenzo Sabine, of Boston (who kindly placed all his papers on the subject at the author's disposal); F. C. Sanford, J. S. Barney, and W. H. Macy, esqrs., and Miss R. A. Gardner, of Nantucket; Maj. S. B. Phinney, of Barnstable; R. L. Pease, esq., of Edgartown; Capt. Silas Jones, of Falmouth; Capt. S. W. Macy, of Newport, R. I.; B. Furnald, esq., custodian of historical records of New York (see numerous quotations, the result mainly of his indefatigable researches); and the collectors and assistants of the ports of Boston and New Bedford. He also acknowledges courtesies from those in charge of the libraries of the Massachusetts Historical, Boston Athenæum, and American Antiquarian Societies.

If in the search for facts the historical idols of others have been shattered, it may be a source of satisfaction to them to learn that the writer has been equally iconoclastic with many that he too has reverenced.

ALEXANDER STARBUCK.

WALTHAM, MASS., *March* 1, 1877.

oceans would much longer have been comparatively unknown,* and with equal truth may it be said that whatever of honor or glory the United States may have won in its explorations of these oceans, the necessity for their explorations was a tribute wrung from the Government, though not without earnest and continued effort, to the interests of our mariners, who, for years before, had pursued the whale in these uncharted seas, and threaded their way with extremest care among these undescribed islands, reefs, and shoals. Into the field opened by them flowed the trade of the civilized world. In their footsteps followed Christianity. They introduced the missionary to new spheres of usefulness, and made his presence tenable. Says a writer in the London Quarterly Review: "The whale fishery first opened to Great Britain a beneficial intercourse with the coast of Spanish America; IT LED IN THE SEQUEL TO THE INDEPENDENCE OF THE SPANISH COLONIES." * * * * * "But for our Whalers, *we never might have founded our colonies in Van Dieman's Land and Australia*—or if we had *we could not have maintained them in their early stages of danger and privation.*—Moreover, our intimacy with the Polynesians must be traced to the same source. The Whalers were the first that traded in that quarter—they PREPARED THE FIELD FOR THE MISSIONARIES; and the same thing is now in progress in New Ireland, New Britain, and New Zealand." All that the English fishery has done for Great Britain, the American fishery has done for the United States—and more. In war our Navy has drawn upon it for some of its sturdiest and bravest seamen, and in peace our commercial marine has found in it its choicest and most skilful officers. In connection with the cod-fishery it schooled the sons of America to a knowledge of their own strength, and in its protection developed and intensified that spirit of self-reliance, independence, and national power to which the conflict of from 1775 to 1783 was a natural and necessary resultant. The wars carried on between England and France from 1600

* The North American Review, in 1834, in an article on the Whale Fishery, says, "A few years since, two Russian discovery ships came in sight of a group of cold, inhospitable islands in the Antarctic Ocean. The commander imagined himself a discoverer, and doubtless was prepared with drawn sword and with the flag of his sovereign flying over his head to take possession in the name of the Czar. At this time he was becalmed in a dense fog. Judge of his surprise, when the fog cleared away, to see a little sealing sloop from Connecticut as quietly riding between his ships as if lying in the waters of Long Island Sound. He learned from the captain that the islands were already well known, and that he had just returned from exploring the shores of a new land at the south; upon which the Russian gave vent to an expression too hard to be repeated, but sufficiently significant of his opinion of American enterprise. After the captain of the sloop, he named the discovery 'Palmer's Land,' in which the American acquiesced, and by this name it appears to be designated on all the recently-published Russian and English charts." A similar experience awaited the English ship Caribou, Captain Cubins, who came in sight of Hurd's Island, and, like the Russian, thought it hitherto unknown land. The similarity was carried still further by the appearance of the schooner Oxford, of Fairhaven (tender to the Arab), the captain of which informed him that the island was discovered by them eighteen months before.

to 1760 had, as one of their objective points, a monopoly of these fisheries on the American coast from the plantations in Maine to the northward, and Port Royal, the culminating point of the conflict revealed to America the secret of her own strength. In the final treaty of peace succeeding the war for Independence the protection of these interests, which the colonists had, unaided, maintained, was made one of the ultimati on the part of the Commissioners for the United States, and subsequent events have demonstrated conclusively the wisdom of their statesmanship. At almost every stage of the arrangement of treaties of peace between England and France prior to 1783 and since 1600, and at almost every similar occasion in treaties between England and the United States subsequently to that time, the question of the fisheries has obtruded itself, and demanded a satisfactory solution. Latterly, it is true, the questions have hinged wholly upon the cod-fishery, since the taking of whales is mostly carried on outside of any national jurisdiction, but prior to and immediately after the war of the Revolution, as late indeed as 1818, the question of whaling was quite as much involved.

The development of this industry in the United States, from the period when a few boats first practiced it along the coast to the time when it employed a fleet of seven hundred stanch ships and fifteen thousand hardy seamen, is an interesting chapter in our national history.

B.—FROM 1600 TO 1700.

CAPE COD, CONNECTICUT, LONG ISLAND, NANTUCKET, MARTHA'S VINEYARD, SALEM.

The American whale fishery (limiting that subject entirely to the prosecution of that pursuit from what is now known as the United States,) is cotemporary with the settlement of the New York and New England colonies. Indeed, one of the main ideas in the settlement of Massachusetts was the founding of a fishing colony, and one of the provisions in the charter guaranteed to the colonists their right to unrestrictedly fish.* It was a serious question with the settlers of Eastern Massachusetts whether to adopt Cape Cod for a residence, or select some more propitious site, and the main arguments adduced for that locality were: "1st. That it afforded a good harbor for boats, though not for ships. 2d. That the ground was well adapted to the raising of corn. 3d. It was a place of profitable fishing, *for large whales of the best kind for*

* "Wee have given and graunted * * * all fishes—royal fishes, whales, balan, sturgeons, and other fishes, of what kinde or nature soever that shall at any tyme hereafter be taken in or within the saide seas or waters, or any of them by the said" (here follow the names of the grantees) "their heires and assignes, or by any other person or persons whatsoever there inhabiting, by them, or any of them, to be appointed to fishe therein." (Charter of Massachusetts.)

oil and bone came daily alongside and played about the ship. The master and his mate, and others experienced in fishing, preferred it to the Greenland whale fishery, and asserted that were they provided with the proper implements, £300 or £400 worth of oil might be obtained." 4th. The situation was healthy, secure, and defensible. 5th. It was in the depth of winter and inexpedient to look further.* Coming from England, as the vast majority of the early settlers did, where the value of the fisheries had already assumed considerable importance, it would have been strange if they had failed to have appreciated this important feature of their surroundings.

At this time the whales were very numerous both along the coast and in deep water.† Their habits seem to have been somewhat migratory, as the boat-whaling season usually commenced very regularly early in November and ceased in March or April. According to some writers, the Indians, before the advent of the whites, were accustomed to pursue the whales in their canoes, and occasionally succeeded in harassing them to death. Their weapons consisted of a rude wooden harpoon, to which was attached a line with a wooden float at the end,‡ and the method of attack was to plunge their instruments of torture into the body of the whale whenever he came to the surface of the water to breathe. In Waymouth's journal of his voyage to America in 1605,§ in describing the Indians on the coast, he says: "One especial thing is their manner of killing the whale, which they call powdawe; and will describe his form; how he bloweth up the water; and that he is twelve fathoms long: and that they go in company of their king with a multitude of their boats; and strike him with a bone made in fashion of a harping iron fastened to a rope, which they make great and strong of the bark of trees, which they veer out after him; then all their boats come about him as he riseth above water, with their arrows they shoot him to death; when they have killed him and dragged him to shore, they call all their chief lords together, and sing a song of joy: and those chief lords, whom they call sagamores, divide the spoil and give to every man a share, which pieces so distributed, they hang up about their houses for provisions; and when they boil them they blow off the fat and put to their pease, maize, and other pulse which they eat." Among the Indians of Rhode Island it was the custom when a whale was cast ashore or killed within their jurisdiction, to cut the flesh into pieces and send to the

* Thatcher's Hist. of Plymouth, p. 21.

† Capt. John Smith, in 1614, found whales so plentiful along the coast that he turned aside from the primary object of his voyage to pursue them. Richard Mather, who came over to the Massachusetts Bay in 1635, records in his journal of the voyage seeing near New England "mighty whales spewing up water in the air, like the smoke of a chimney, and making the sea about them white and hoary, as is said in Job, of such incredible bigness that I will never wonder that the body of Jonas could be in the belly of a whale." (Sabine's Report, p. 42.)

‡ "Etchings of a Whaling Cruise," Browne, p. 522.

§ Mass. Hist. Soc. Coll., iii series, viii vol., 156 p.

neighboring tribes as a present of peculiar value.* Scammon says:† "It has been stated by several writers that the American colonists followed up the Indian mode of capturing the whale, by first striking it with a harpoon having a log of wood attached to it by a line, even as late as the commencement of the Sperm Whale fishery." It is quoted that the Hon. Paul Dudley stated: "Our people formerly used to kill the whale near the shore, but now they go off to sea in sloops and *whale-boats*. Sometimes the whale is killed by a single stroke, and yet at other times she will hold the whalemen in play *near half a day together*, with their lances; and sometimes they will get away after they have been lanced and spouted thick blood, with irons in them, and drags (droges) fastened to them, which are thick boards about fourteen inches square." * * * "We are of the opinion, however, that the colonial whalers did not follow the Indian mode of whale-fishing; for it is well known that the British whalers, as early as 1670, used the line attached to the boat, and, so far as the drags or 'droges' are concerned, they are used at the present day in cases of emergency.‡

As early as 1639, Massachusetts, with an eye to the importance of the fisheries, passed an act to encourage them. By its provisions all vessels employed in taking or transporting fish were exempted from all duties and taxes for the term of seven years, and all fishermen were exempted from military service during the fishing season. As important as the pursuit of whaling seemed to have been considered by the first settlers, many years seem to have elapsed before it was followed as a business, though probably something was attempted in that direction prior to any recorded account that we have. The subject of drift-whales appears to have attracted considerable importance both in the Plymouth and the Massachusetts Bay colonies. The colonial government claimed a portion, a portion was allowed to the town, and the finder, if no other

* Arnold's Hist. R. I., i, p. 85. Among the Montauk Indians the most savory sacrafice to their deity was the tail or fin of the whale. (Hedge's Address, p. 35.) The Greenlander's idea of Heaven, according to Father Hennepin, was a place where there would be an immense cauldron continually boiling, and each could take as much seal blubber, ready cooked, as he wanted.

† Marine Mammalia and American Whale Fishery, p. 204, note.

‡ It would appear from Purchas' account that lines were used to attach the boat to the whale as early as 1613. He writes: "I might here recreate your wearied eyes with a hunting spectacle of the greatest chase which nature yieldeth; I mean the killing of a whale. When they espy him on the top of the water (which he is forced to for to take breath), they row toward him in a shallop, in which the harpooner stands ready with both his hands to dart his harping iron, *to which is fastened a line of such length that the whale (which suddenly feeling himself hurt, sinketh to the bottom,) may carry it down with him, being before fitted that the shallop be not therewith endangered*; coming up again, they strike him with lances made for that purpose, about twelve feet long, the iron eight thereof, and the blade eighteen inches—*the harping iron principally serving to fasten him to the shallop*, and thus they hold him in such pursuit, till after streams of water, and next of blood, cast up into the air and water, (as angry with both elements, which have brought thither such weak hands for his destruction,) he at length yieldeth up his slain carcass as meed to the conquerors."

claimant appeared to dispute his title, might presume to claim the other third. Evidently at times some disposition to rebel was manifested, for in 1661, the general court of Plymouth Colony sent to Sandwich, Barnstable, Yarmouth, and Eastham the following proposition:

"OCT. 1, 1661.—LOUEING FRINDS: Whereas the Generall Court was pleased to make some proposition to you respecting the drift fish or whales; in case you should refuse theire proffer, they impowered mee, though vnfitt, to farme out what should belonge vnto them on that account; and seeing the time is expired, and it fales into my hands to dispose of, I doe therefore, with the advice of the Court, in answare to your remonstrance, say, that if you will duely and trewly pay to the countrey for euery whale that shall come one hogshead of oyle att Boston, where I shall appoint, and that current and merchantable, without any charge or trouble to the countrey.*—I say, for peace and quietness sake you shall have it for this present season, leaueing you and the Election Court to settle it soe as it may bee to satisfaction on both sides; and in case you accept not of this tender, to send it within fourteen dayes after the date heerof and if I heare not from you, I shall take it for graunted that you will accept of it, and shall expect the accomplishment of the same.

"Youers to vse,

"CONSTANT SOUTHWORTH TREASU."†

The offer was accepted and indorsed as follows:

"THE SIXT OF THE FIRST MONTH 61-62.

"Agreement to give 2 bbls of oyle from each whale according to proposition made for yeare past, to end all troubles.

"ANTHONY THACHER.
"ROBERT DENIS.
"THOMAS BOARDMAN.
"RICHARD TAYLER."

Numerous instances of orders relating to drift-whales occur in the records of Plymouth, Massachusetts, and New York. In 1662, the town of Eastham voted that a part of every whale cast ashore should be appropriated for the support of the ministry.‡ Many were the disputes that the general court was called upon to adjust in regard to stranded whales, but the decisions seem to be, if not generally satisfactory, at least universally acquiesced in.

The earliest account of whale-killing by the people of Cape Cod comes to us in the form of a tradition, and quite an unsatisfactory and improba-

* By an order of court, June 6, 1654, whales cast up on lands of purchasers belonged to said proprietors. (Plym. Col. Rec. iii, p. 53.) This being much more satisfactory than the order compelling tribute to the government, probably caused ill-feeling when the general court preferred a claim.

† Plym. Col. Rec., vol. iv, p. 6.

‡ Freeman's Hist. Cape Cod, ii, p. 362.

ble tradition, too. It is to the effect that one William Hamilton was the first to kill these fish from that region, and he was obliged to remove from that section of country, as his fellow-citizens persecuted him for his skill, attributing his success to undue familiarity with evil spirits. Hamilton is said to have removed to Rhode Island, and from thence to Connecticut, where he died in 1746, aged 103 years. Several things militate against this story. Neither the annals of the Cape* nor genealogical registers contain any record of him. Naturally the courts would take some cognizance of an offense so heinous that the offender was openly persecuted, but we do not find him noted as a criminal. The people who settled on the Cape were too familiar with fishing to attribute success to aught but skill and natural causes, and the Cape was more an asylum for the persecuted than the source of persecution. It is far more probable that at the time of his birth, if he ever existed there, there were people familiar with this art in that region. It had certainly become a pursuit of much importance in other sections of the country long before he was old enough to handle a harpoon, and the product of this fishery had found its way to Boston while he was yet a young man.

In 1688 Secretary Randolph writes home from Massachusetts: "New Plimouth Colony have great profit by whale killing. I believe it will be one of our best returnes, now beaver and peltry fayle us."† In March of the same year there was placed on the colonial records of Massachusetts Bay a memorandum embodying the universally recognized law of whalemen that "craft claims the whale." It specifies: "furst: if aney pursons shall find a Dead whael on the streem And have the opportunity to toss herr on shoure; then ye owners to alow them twenty shillings; 2ly: if thay cast hur out & secure ye blubber & bone then ye owners to pay them for it 30*s* (that is if ye whael ware lickly to be loast;) 3ly, if it proves a floate son not killed by men then ye Admirall to Doe thaire in as he shall please;—4ly; that no persons shall presume to cut up any whael till she be vewed by toe persons not consarned; that so ye Right owners may not be Rongged of such whael or whaels; 5ly, that no whael shall be needlessly or fouellishly lansed behind ye vitall to avoid stroy; 6ly, that each companys harping Iron & lance be Distinckly marked on ye heads & socketts with a poblick mark: to ye prevention of strife; 7ly, that if a whale or whalls be found & no Iron in them: then thay that lay ye neerest claime to them by thaire strokes & ye natoral markes to haue them; 8ly, if 2 or 3 companyes lay equal claimes, then thay equelly to shear."‡

In November, 1690, the colony of New Plymouth appointed "Inspectors of Whale," in order to the "prevention of suits by whalers." The

* It is scarcely probable that so careful a historian as Freeman would have omitted to make mention of Hamilton, if this story of him had any foundation in fact.

† Hutchinson's Coll., p. 558.

‡ Mass. Col. MSS., Treasury, iii, p. 80.

rules governing them were: "1. All whales killed or wounded & left at sea the killers to repaire to the inspectors & give marks, time, place, which shall be recorded. 2. All whales brought or cast ashore to be viewed by inspector or deputy before being cut & marks & wounds recorded with time & place. 3. Any person cutting or defacing whale before being viewed unless necessary shall lose right to it, & pay 10£ to county, & fish to be seized by inspectors for owners' use. Inspectors to have power to make deputy and allow 6*s.* per whale. 4. Those finding whale a mile from shore not appearing to be killed by man shall be first to secure them, pay 1 hogshead of oyle to ye county for each whale." *

In 1647 (May 25) at a meeting of the general court held at Hartford, Conn., the following resolve was passed: "Yf Mr. Whiting, wth any others shall make tryall and p^{r}secute a designe for the takeing of whale wthin these libertyes, and if vppon tryall wthin the terme of two yeares, they shall like to goe on, noe others shalbe suffered to interrupt the, for the tearme of seauen yeares." † Whether Mr. Whiting, who seems to have been quite a prominent man and a merchant at Hartford, ever did "prosecute his designe," or not, we are left to conjecture; but so far as we at present know, this is the earliest official document showing any intention in that direction, and many years elapse before Connecticut again claims attention upon this subject.

It is probably safe to assert that the first organized prosecution of the American whale-fishery was made along the shores of Long Island. The town of Southampton, which was settled in 1640 by an offshoot from the Massachusetts Colony at Lynn,‡ was quick to appreciate the value of this source of revenue. In March, 1644, the town ordered the town divided into four wards of eleven persons to each ward, to attend to the drift-whales cast ashore. When such an event took place two persons from each ward (selected by lot) were to be employed to cut it up. "And every Inhabitant with his child or servant that is above sixteen years of age shall have in the Division of the other part," (*i. e.* what remained after the cutters deducted the double share they were, ex officio, entitled to) "an equall proportion provided that such person when yt falls into his ward a sufficient man to be imployed aboute yt." § Among the names of those delegated to each ward are many whose descendants became prominent in the business as masters or owners of vessels—the Coopers, the Sayres, Mulfords, Peirsons, Hedges, Howells, Posts, and others. A few years later the number of "squadrons" was increased to six.

* Plym. Col. Rec. vi, pp. 252–3.

† Conn. Col. Rec., i, p. 154.

‡ Southampton was settled under a patent from the Earl of Sterling, and the privileges accorded were essentially those of the Massachusetts Bay Colony. In 1664 the commissioners to adjust the colonial bounds decided this and the adjacent towns to be within the jurisdiction of the Duke of York.

§ Howell's Hist. of Southampton, p. 179.

In February, 1645, the town ordered that if any whale was cast ashore within the limits of the town no man should take or carry away any part thereof without order from a magistrate, under penalty of twenty shillings. Whoever should find any whale or part of a whale, upon giving notice to a magistrate, should have allowed him five shillings, or if the portion found should not be worth five shillings the finder should have the whole. "And yt is further ordered that yf any shall finde a whale or any peece thereof upon the Lord's day then the aforesaid shillings shall not be due or payable."* "This last clause" says Howell, "appears to be a very shrewd thrust at 'mooning' on the beach on Sundays."

It was customary a few years later to fit out expeditions of several boats each for whaling along the coast, the parties engaged camping out on shore during the night. These expeditions were usually gone about one or two weeks.† Indians were usually employed by the English, the whites furnishing all the necessary implements, and the Indians receiving a stipulated proportion of oil in payment.

In Easthampton on the 6th of November, 1651, "It was Ordered that Goodman Mulford shall call out ye Town by succession to loke out for whale."‡ Easthampton, however, like every other town where whales were obtainable, seems to have had its little unpleasantnesses on the subject, for in 1653 the town "Ordered that the share of whale now in controversie between the Widow Talmage and Thomas Talmage" (alas for the old-time Chesterfieldian gallantry) "shall be divided among them as the lot is."§ In the early deeds of the town the Indian grantors were to be allowed the fins and tails of all drift-whales; and in the deed of Montauk Island and Point, the Indians and whites were to be equal sharers in these prizes.‖ In 1672 the towns of Easthampton, Southampton, and Southwold presented a memorial to the court at Whitehall "setting forth that they have spent much time and paines, and the greatest part of their Estates, in settling the trade of whale-fishing in the adjacent seas, *having endeavoured it above these twenty yeares*, but could not bring it to any perfection till within these 2 or 3 yeares last past. And it now being a hopefull trade at New Yorke, in America, the Governor and the Dutch there do require ye Petitioners to come under their patent, and lay very heavy taxes upon them beyond any of his Ma^ties^ subjects in New England, and will not permit the petitioners to have any deputys in Court,¶ but being chiefe, do impose what Laws they please upon them, and insulting very much over the Petitioners threaten to cut down their timber which is but little they have to Casks for oyle, altho' the Pet^rs^ purchased their landes of the Lord Sterling's deputy, above 30 yeares since, and have till now under the Government and Pat-

¶ In this petition is an early assertion of the twinship of taxation and representation, for which Massachusetts and her offshoots were ever strenuous.

ent of Mr. Winthrop, belonging to Conitycut Patent, which lyeth far more convenient for ye Petitioners assistance in the aforesaid Trade." They desire, therefore, either to continue under the Connecticut government, or to be made a free corporation. This petition was referred to the "Council on Foreign Plantations."

This would make the commencement of this industry date back not far from the year 1650. In December, 1652, the directors of the Dutch West India Company write to Director General Peter Stuyvesant, of New York: "In regard to the whale fishery we understand that it might be taken in hand during some part of the year. If this could be done with advantage, it would be a very desirable matter, and make the trade there flourish and animate many people to try their good luck in that branch.*" In April, (4th,) 1656, the council of New York "received the request of Hans Jongh, soldier and tanner, asking for a ton of train-oil or *some of the fat of the whale lately captured.*†

In April, 1669, Mr. Samuel Mavericke writes to Colonel Nicolls:‡

"On ye East end of Long Island there were 12 or 13 whales taken before ye end of March, and what since.wee heare not; here are dayly some seen in the very harbour, sometimes within Nutt Island. Out of the Pinnace the other week they struck two, but lost both, the iron broke in one, the other broke the warpe.§ The Governor hath encouraged some to follow this designe. Two shallops made for itt, but as yett wee doe not heare of any they have gotten."

In 1672, the town of Southampton passed an order for the regulation of whaling, which, in the latter part of the year, received the following confirmation from Governor Lovelace: "Whereas there was an ordinance made at a Towne-Meeting in South Hampton upon the Second Day of May last relating to the Regulation of the Whale fishing and Employment of the Indyans therein, wherein particularly it is mentioned. That whosoever shall Hire an Indyan to go a-Whaling, shall not give him for his Hire above one Trucking Cloath Coat, for each whale, hee and his Company shall Kill, or halfe the Blubber, without the Whale Bone under a Penalty therein exprest: Upon Considerac'on had thereupon, I have thought good to Allow of the said Order, And do hereby Confirm the same, untill some inconvenience therein shall bee made appeare, And do also Order that the like Rule shall bee followed at East Hampton and other Places if they shall finde it practicable amongst them.

"Given under my hand in New Yorke, the 28th of Novemb'r, 1672.

[Sign.] "FRAN: LOVELACE."‖

---

§ It would seem by this that as early as 1669 American whalemen were accustomed to fasten to the whale with their line.

‖ N. Y. Col., MSS.

Upon the same day that the people of Southampton passed the foregoing order, Governor Lovelace also issued an order citing that in consequence of great abuse to his Royal Highness in the matter of drift-whales upon Long Island, he had thought fit to appoint Mr. Wm. Osborne and Mr. John Smith, of Hempstead, to make strict inquiries of Indians and English in regard to the matter.*

It was early found to be essential that all important contracts and agreements, especially "between the English and Indians relating to the killing of whales should be entered upon the town books, and signed by the parties in presence of the clerk and certified by him. Boat-whaling was so generally practiced and was considered of so much importance by the whole community, that every man of sufficient abilits in the town was obliged to take his turn in watching for whales from some elevated position on the beach, and to sound the alarm on one being seen near the coast."† In April, (2d,) 1668, an agreement was entered on the records of Easthampton, binding certain Indians of Montauket in the sum of £10 sterling to go to sea, whaling, on account of Jacobus Skallenger and others, of Easthampton, beginning on the 1st of November and ending on the 1st of the ensuing April, they engaging "to attend dilligently with all opportunitie for ye killing of whales or other fish, for ye sum of three shillings a day for every Indian: ye sayd Jacobus Skallenger and partners to furnish all necessarie craft and tackling convenient for ye designe." The laws governing these whaling-companies were based on justice rather than selfishness. Among the provisions was one passed January 4, 1669, whereby a member of one company finding a dead whale killed by the other company was obliged to notify the latter. A prudent proviso in the order was that the person bringing the tidings should be well rewarded. If the whale was found at sea, the killers and finders were to be equal sharers. If irons were found in the whale, they were to be restored to the owners.‡ In 1672, John Cooper desired leave to employ some "strange Indians" to assist him in whaling, which leave was granted;§ but these Indian allies required tender handling, and were quite apt to ignore their contracts when a fair excuse could be found, especially if their hands had already closed over the financial consideration. Two or three petitions relating to cases of this kind are on file at New York. One of them is from "Jacob Skallenger, Stephen Hand, James Loper and other adjoined with them in the Whale Designe at Easthampton," and was presented in 1675. It sets forth that they had associated together for the purpose of whaling, and agreed to hire twelve Indians and man two boats. Having seen the natives yearly employed both by neighbors and those in surrounding towns, they thought there could be no objec-

* N. Y. Col., MSS., General Entries iv, p. 123, Francis Lovelace.

† Howell's Southampton.

‡ This code was very similar to that afterward adopted in the Massachusetts Bay.

§ N. Y. Col. MSS.; General Entries, iv, p. 235.

tion to their doing likewise. Accordingly, they agreed in June with twelve Indians to whale for them during the following season. "But it fell out soe that foure of the said Indians (competent & experienced men) belonged to Shelter-Island whoe with the rest received of your peticon^{rs} in pt. of their hire or wages 25*s.* a peece in hand at the time of the contract, as the Indian Custome is and without which they would not engage themselves to goe to Sea as aforesaid for your Peticon^{rs}." Soon after this there came an order from the governor requiring, in consequence of the troubles between the English and the aborigines, that all Indians should remain in their own quarters during the winter. "And some of the towne of Easthampton wanteing Indians to make up theire crue for whaleing they take advantage of your hon^{rs} s^{d} Ordre thereby to hinder your peticon^{rs} of the said foure Shelter-Island Indians. One of ye Overseers being of the Company that would soe hinder your peticon^{rs}. And Mr. Barker warned yo^{r} peticon^{rs} not to entertaine the said foure Indians without licence from your hon^{r}. And although some of your peticoners opposites in this matter of great weight to them seek to prevent yo^{r} peticon^{rs} from haveing those foure Indians under pretence of zeal in fullfilling y^{r} hon^{rs} order, yet it is more then apparent that they endeavor to break yo^{r} peticon^{rs} Company in y^{t} maner that soe they themselves may have opportunity out of the other eight Easthampton Indians to supply theire owne wants." After representing the loss liable to accrue to them from the failure of their design and the inability to hire Easthampton Indians, on account of their being already engaged by other companies, they ask relief in the premises,* which Governer Andross, in an order dated November 18, 1675, grants them, by allowing them to employ the aforesaid Shelter-Island Indians.†

Another case is that of the widow of one Cooper, who in 1677 petitions Andross to compel some Indians who had been hired and paid their advance by her late husband to fulfill to her the contract made with him, they having been hiring out to other parties since his decease.‡

The trade in oil from Long Island early gravitated to Boston and Connecticut, and this was always a source of much uneasiness to the authorities at New York. The people inhabiting Easthampton, Southampton, and vicinity, settling under a patent with different guarantees from those allowed under the Duke of York, had little in sympathy with that government, and always turned toward Connecticut as their natural ally and Massachusetts as their foster mother. Scarcely had what they looked upon as the tyrannies of the New York governors reduced them to a sort of subjection when they were assailed by a fresh enemy. A sudden turn of the wheel of fortune brought them, in 1673, a second time under the control of the Dutch. During this interregnum, which lasted from July, 1673, to November, 1674, they were summoned, by their then

* N. Y. Col. MSS., xxv, Sir Ed. Andross, p. 41.

† Warrants, Orders, Passes, &c., 1674–1679, p. 161.

‡ N. Y. Col. MSS., xxvi, p. 153.

conquerors, to send delegates to an assembly to be convened by the temporary rulers. In reply the inhabitants of Easthampton, Southampton, Southold, Seatoocook, and Huntington returned a memorial setting forth that up to 1664 they had lived quietly and prosperously under the government of Connecticut. Now, however, the Dutch had by force assumed control, and, understanding them to be well disposed, the people of those parts proffer a series of ten requests. The ninth is the particular one of interest in this connection, and is the only one not granted. In it they ask, "That there be ffree liberty granted ye 5 townes aforesd for ye procuring from any of ye united Collonies (without molestation on either side:) warpes, irons or any other necessaries ffor ye comfortable carring on the whale design." To this reply is made that it "cannot in this conjunction of time be allowed." "Why," says Howell,* "the Council of Governor Colve chose thus to snub the English in these five towns in the matter of providing a few whale-irons and necessary tackle for capturing the whales that happened along the coast, is inconceivable;" but it must be remembered that the English and Dutch had long been rivals in this pursuit, even carrying their rivalry to the extreme of personal conflicts. The Dutch assumed to be, and practically were, the factors of Europe in this business at this period, and would naturally be slow to encourage any proficiency in whaling by a people upon whom they probably realized that their lease of authority would be brief. Hence, although they were willing to grant them every other right in common with those of their own nationality, maritime jealousy made this one request impracticable. How the people of Long Island enjoyed this state of affairs is easy to infer from their petition of 1672. The oppressions alike of New York governors and Dutch conquerors could not fail to increase the alienation that difference of habits, associations, interests, and rights had implanted within them. Among other arbitrary laws was one compelling them to carry all the oil they desired to export to New York to be cleared, a measure which produced so much dissatisfaction and inconvenience that it was beyond a doubt "more honored in the breach than in the observance." At times some captain, more scrupulous than the rest, would obey the letter of the law or procure a remission of it. Thus, in April, 1678, Benjamin Alford, of Boston, in New England, merchant, petitioned Governor Brockholds for permission to clear with a considerable quantity of oil that he had bought at Southampton, directly from that port to London, he paying all duties required by law. This he desires to do in order to avoid the hazard of the voyage to New York and the extra danger of leakage thereby incurred. He was accordingly allowed to clear as he desired.†

* Hist. of Southampton, p. 62.

† N. Y. Col. MSS., xxvii, pp. 65, 66. Accompanying the order is a blank clearance reading as follows: "Permitt & suffer the good —— of —— A. B. Commander, bound for the Port of London in Old England to passe from the Harbor at the North-Sea near Southton at the East End of Long Isl. with her loading of Whale Oyl &

In 1684 an act for the "Encouragement of trade and Navigation" within the province of New York was passed, laying a duty of 10 per cent. on all oil and bone exported from New York to any other port or place except directly to England, Jamaica, Barbadoes, or some other of the Caribbean Islands.

In May, 1688, the Duke of York instructs his agent, John Leven, to inquire into the number of whales killed during the past six years within the province of New York, the produce of oil and bone, and "about his share."* To this Leven makes reply that there has been no record kept, and that the oil and bone were shared by the companies killing the fish. To Leven's statement, Andross, who is in England defending his colonial government, asserts that all those whales that were driven ashore were killed and claimed by the whalers or Indians.†

In August, 1688, we find the first record of an intention to obtain sperm oil. Among the records in the State archives at Boston is a petition from Timotheus Vanderuen, commander of the brigantine Happy Return, of New Yorke, to Governor Andross, praying for "Licence and Permission, with one Equipage Consisting in twelve mariners, twelve whalemen and six Diuers—from this Port, upon a fishing design about the Bohames Islands, And Cap florida, for sperma Coeti whales and Racks: And so to returne for this Port."‡ Whether this voyage was ever undertaken or not we have no means of knowing, but the petition is conclusive evidence that there were men in the country familiar even then with some of the haunts of the sperm whale and with his capture.

Francis Nicholson, writing from Fort James, December, 1688, says: "Our whalers have had pretty good luck, killing about Graves End three large whales. On the Easte End aboute five or six small ones."§ During this same year the town of Easthampton being short of money, debtors were compelled to pay their obligations in produce, and in order to have some system of exchange the trustees of the town "being Legally met March 6, 1688–9 it was agreed that this year's Towne rate should be held to be good pay if it be paid as Follows:

	£.	s.	d.
"Dry merchantable hides att	0	0	6
"Indian Corn	0	3	0

‖ Bi-Centennial Address at Easthampton, p. 41.

The first whaling expedition in Nantucket "was undertaken," says Macy,* "by some of the original purchasers of the island; the circumstances of which are handed down by tradition, and are as follows: A whale, of the kind called 'scragg,' came into the harbor and continued there three days. This excited the curiosity of the people, and led them to devise measures to prevent his return out of the harbor. They accordingly invented and caused to be wrought for them a harpoon, with which they attacked and killed the whale. This first success encouraged them to undertake whaling as a permanent business; whales being at that time numerous in the vicinity of the shores."

In 1672 the islanders, evidently desirous of making further progress in this pursuit, recorded a memorandum of a proposed agreement with one James Loper, in which it is said that the said James "doth Ingage to carrey on a Designe of Whale Catching on the Island of Nantucket that is to say James Ingages to be a third in all Respects, and som of the Town Ingages also to carrey on the other two thirds with him in like manner—the town doth also consent that first one company shall begin, and afterwards the rest of the freeholders or any of them have Liberty to set up another Company provided they make a tender to those freeholders that have no share in the first company and if any refuse the rest may go on themselves, and the town doth engage that no other Company shall be allowed hereafter; also, whoever kill any whales, of the Company or Companies aforesaid, they are to pay to the Town for every such whale five shillings and for the Incoragement of the said James Loper the Town doth grant him ten acres of Land in sume Convenant place that he may chuse in (Wood Land Except) and also liberty for the commonage of three cows and Twenty sheep and one horse with necessary wood and water for his use, on Conditions that he follow the trade of whalling on this Island two years in all seasons thereof beginning the first of March next Insuing; also he is to build upon his Land and when he leaves Inhabiting upon this Island then he is first to offer his Land to the Town at a valuable price and if the Town do not buy it he may sell it to whom he please; the commonage is granted only for the time of his staying here."† At the same meeting John Savidge had a

* Hist. Nantucket, p. 28.

† There are most excellent reasons for concluding that Loper never went to Nantucket. When the parties to whom grants were made settled there, their lots were surveyed and laid out to them and the survey recorded. In Loper's case no after-mention occurs of him in any place or manner, and in the list of proprietors and their grants, made up in 1674, and forwarded to New York, his name is not mentioned. Notwithstanding the islanders, in their desire to honor and perpetuate his name, called two of their ships after him, those who are best judges in the matter concede that he never had a residence there. One James Loper (or Looper) resided at Easthampton and carried on whaling from there prior to 1675 (see petition of Shallenger, Hand & Loper). Undoubtedly this is the man referred to in the Nantucket records. Up to the year 1678, however, he still owned property in Easthampton. In regard to the Loper mentioned by Felt (Annals of Salem, p. 223), and who has been supposed (see Savage's

grant made to him, upon condition that he took up his residence on the island for the space of three years, and also that he should "follow his trade of a cooper upon the island as the Town or whale Company have need to employ him." Loper beyond a doubt never improved this opportunity offered him of immortalizing himself, but Savidge did, and a perverse world has, against his own will, handed down to posterity the name of Loper, who did not come, while it has rather ignored that of Savidge, who did remove to that island.

The history of whaling upon Nantucket from that time until 1690 is rather obscure. There is a tradition among the islanders that in this year several persons were standing upon what was afterward known as Folly House Hill, observing the whales spouting and sporting in the sea. One of these people, pointing to the ocean, said to the others: "There is a green pasture, where our children's grandchildren will go for bread."* It would be a matter of interest to know the name of the individual to whom this prophetic vision was revealed, but tradition is almost always lame somewhere. In 1690 the people of Nantucket, "finding that the people of Cape Cod had made greater proficiency in the art of whale-catching than themselves," sent thither and employed Ichabod Paddock to remove to the island and instruct them in the best method of killing whales and obtaining the oil.† Judging from subsequent events, he must have come and proved himself a good teacher and they most admirable pupils.

The earliest mention of whales at Martha's Vineyard occurs in November, 1652, when Thomas Daggett and William Weeks were appointed "whale cutters for this year." The ensuing April it was "Ordered by the town that the whale is to be cut out freely, four men at one time, and four at another, and so every whale, beginning at the east end of the town." In 1690 Mr.‡ Sarson and William Vinson were appointed by "the proprietors of the whale" to oversee the cutting and sharing of all whales cast on shore within the bounds of Edgartown, "they to have as much for their care as one cutter."

genealogical dictionary) to be the one spoken of, the petition (Mass. Col. MSS., Usurpation, ii, p. 136) gives his name as *Jacobus* Loper, and it is by this name alone he is known. Thus in 1686 the constable of Eastham was ordered to attach *Jacobus* Loper to find sureties for good behavior and appearance at the next court, and at the October term *Jacobus* Loper was acquitted of a criminal charge. In no place does the Latin name undergo a change, and accompanying circumstances would scarcely seem to imply that the appellation was ever intended to be James. On the contrary the Nantucket document plainly says James, as also do the MSS. relating to Easthampton, and in no place is the Latinized form used.

* Macy's Nantucket, p. 33.

† Macy's Nantucket, pp. 29–30. No record exists of this save in the form of tradition, but many circumstances give it an appearance of far greater probability than the story concerning Loper. Among other things, it is related as an historical fact by Zaccheus Macy (Mass. Hist. Soc., Col. iii, p. 155), who died in 1797, aged 83 years, and hence was cotemporary with some of the men living in Paddock's time. He, however, makes no mention of Loper.

‡ Richard L. Pease, esq., in Vineyard Gazette.

In 1692 came the inevitable dispute of proprietorship. A whale was cast on shore at Edgartown by the proprietors, "seized by Benjamin Smith and Mr. Joseph Norton in their behalf," which was also claimed by "John Steel, harpooner, on a whale design, as being killed by him." It was settled by placing the whale in the custody of Richard Sarson, esq., and Mr. Benjamin Smith, as agents of the proprietors, to save by trying out and securing the oil; "and that no distribution be made of the said whale, or effects, till after fifteen days are expired after the date hereof, that so such persons who may pretend an interest or claim, in the whale, may make their challenge; and in case such challenge appear sufficient to them, then they may deliver the said whale or oyl to the challenger; otherwise to give notice to the proprietors, who may do as the matter may require."

Mr. Felt, in his History of Salem,* says that James Loper, of that town, in 1688, petitioned the colonial government of Massachusetts for a patent for making oil. In his petition Loper represents that he has been engaged in whale-fishing for twenty-two years.

On the 12th of March, 1692, John Higginson and Timothy Lindall, of Salem, wrote to Nathaniel Thomas: "We have been jointly concerned in severall whale voyages at Cape Cod, and have sustained greate wrong and injury by the unjust dealing of the inhabitants of those parts, especially in two instances: ye first was when Woodbury and company, in our boates, in the winter of 1690, killed a large whale in Cape Cod harbour. She sank and after rose, went to sea with a harpoon, warp, etc. of ours, which have been in the hands of Nicholas Eldredge. The second case is this last winter, 1691. William Edds and company, in one of our boates, struck a whale, which came ashore dead, and by ye evidence of the people of Cape Cod was the very whale they killed. The whale was taken away by Thomas Smith, of Eastham, and unjustly detained."†

Nor was the art of whaling unknown or unpracticed by our Canadian neighbors in these early years, for M. de Denonville writes to M. de Seignelay, in 1690, that the Canadians are adroit in whaling, and that the "last ships have brought to Quebec, from Bayonne, some harpooners for Sieur Riverin."‡

---

* Vol. ii, p. 224.

† *Ibid.*

‡ Memoir on Acadia, &c., N. Y. Col. Rec., ix, pp. 444–5. Holmes, in his "American Annals" (vol. i, p. 133), says: "Other English ships went this year (1593) to Cape Breton. This is the first mention, that we find, of the whale-fishery by the English. Although they found no whales in this instance, yet they discovered on an island eight hundred whale fins where a Biscay ship had been three years before; and this is the first account we have of whale fins or whale bone by the English." So it appears that for a long term of years Canadian waters were the whaleman's garden.

C.—1700 TO 1750.

NANTUCKET; LONG ISLAND; CAPE COD; SALEM; BOSTON; RHODE ISLAND; MARTHA'S VINEYARD, ETC.

Immediately after the commencement of the eighteenth century the town of Sherburne,* on the island of Nantucket, advanced rapidly to the front rank among whaling ports. So plentiful was their prey almost at their very doors, as it were, that no difficulty was at first experienced by the islanders in obtaining all the oil they desired without going out of sight of land. "The south side of the island," says a writer,† "was divided into four equal parts, and each part was assigned to a company of six, which, though thus separated, still carried on their business in common. In the middle of this distance" (of about three and a half miles to each division) "they erected a mast, provided with a sufficient number of rounds, and near it they built a temporary hut where five of the associates lived, whilst the sixth from his high station carefully looked toward the sea, in order to observe the spouting of whales." When one was seen, the boats were launched and the chase commenced. Sometimes, in pleasant weather, the whalemen would venture nearly out of sight of land. A capture once made, the whale was towed ashore and the blubber "saved" after the manner of cutting in on board a vessel. Try-works were erected on the beach, and the blubber, after being cut up and sliced, was subjected to the process of "trying out." These try-works were used for many years after exclusive shore-fishing had ceased, the blubber of the whales captured at sea being cut up into square pieces and stowed into casks on board of the vessels. On the return home this product was removed to the try-houses and the oil extracted. This was substantially the method of carrying on the fishery all along the coast. As the natural consequence of long-continued practice, the inhabitants of Nantucket soon acquired great dexterity in the pursuit. Says St. John: "These people are become superior to any other whalemen."‡ In this business many Indians were employed, each boat's crew being manned in part, some wholly, by aborigines, the most active among them being promoted to steersmen, and even at times one of them being allowed to command a boat. Under the stimulus of this

* So called prior to 1795; since then better known as Nantucket.

† Letters from an American farmer, J. Hector St. John Crevecœur. Within the past twenty five years, when whales were seen off Southampton, the alarm was sounded by means of a horn and boats were hastily manned in pursuit, and to the present day boats and whaling craft are kept in readiness to start in pursuit of whales at a moment's warning.

‡ J. Hector St. John de Crevecœur. "Letters of an American Farmer." (Published 1782.) It is a somewhat disputed question whether St. John ever visited Nantucket or not. If he never did, his description of customs, &c., is remarkably accurate for hearsay evidence.

encouragement they soon became experienced whalemen and conversant with all the details of the business.*

The first sperm whale taken by Nantucket whalemen was captured by Christopher Hussey, about the year 1712, and the capture, destined to effect a radical change in the pursuit of this business, was the result of an accident. "He was cruising," says Macy,† "near the shore for Right whales, and was blown off some distance from the land by a strong northerly wind, where he fell in with a school of that species of whales, and killed one and brought it home. * * * * This event gave new life to the business, for they immediately began with vessels of about thirty tons to whale out in the 'deep,' as it was then called, to distinguish it from shore whaling. They fitted out for cruises of about six weeks, carried a few hogsheads, enough probably to contain the blubber of one whale, with which, after obtaining it, they returned home. The owners then took charge of the blubber, and tried out the oil, and immediately sent the vessels out again."‡ In 1715 Nantucket had six sloops engaged in this fishery, producing oil to the value of £1,100 sterling, the shore fishery being, in the mean time, still continued. There was no perceptible diminution in the number of whales taken from along the coast for quite a number of years after the establishment of the fishery.

In 1720 the inhabitants of Nantucket made a small shipment of oil to London in the ship Hanover, of Boston, William Chadder, master.§

---

* Macy's Hist., p. 30.

† *Ibid.*, p. 36.

‡ The first sperm whale *known* to Nantucket "was found dead, and ashore, on the southwest part of the island. It caused considerable excitement, some demanding a part of the prize under one pretence, some under another, and all were anxious to behold so strange an animal. There were so many claimants of the prize, that it was difficult to determine to whom it should belong. The natives claimed the whale because they found it" (not a bad reason surely); "the whites, to whom the natives made known their discovery, claimed it by a right comprehended, as they affirmed, in the purchase of the island." (Ah! what lawyers they must have been!) "An officer of the crown" (here steps in the lion) "made his claim, and pretended to seize the fish in the name of His Majesty, as being property without any particular owner. * * * * It was finally settled that the *white* inhabitants who first found the whale, should share the prize equally amongst themselves." (Alas for royalty, and alas for the finders!). The teeth, considered very valuable, had been prudently taken care of by a white man and an Indian before the discovery was made public. The decision in regard to ownership certainly justified their precaution. This compromise made, the whale was cut up and the oil extracted. What the amount of it was is unknown. "The sperm procured from the head was thought to be of great value for medical purposes. It was used both as an internal and an external application; and such was the credulity of the people, that they considered it a certain cure for all diseases; it was sought with avidity, and, for a while, was esteemed to be worth its weight in silver."—(Macy's Hist.)

§ "Shipped by the grace of God, in good order and well conditioned, by Paul Starbuck, in the good ship called the Hanover, whereof is master under God for the present voyage, William Chadder and now riding in the harbour of Boston, and by God's grace bound for London; to say:—six barrels of

[N. S.]

Whether this was the first adventure of this kind or not we have no means of ascertaining, and we are in a similar state of uncertainty in regard to its success. As the fishery became more important, and vessels were used, it became necessary to select the site where there was the best harbor, and the location where the town of Nantucket now stands was selected.* As the number of vessels increased it was also found necessary to replace the old landing-places, which at best were only temporary, and often destroyed by winter storms, with more substantial wharves, and accordingly, in 1723, the "Straight" wharf was built.† At this time the usual custom in winter was to haul the vessels and boats up on shore, as being safer and less expensive than lying at the wharf. The boats were placed bottom upwards and lashed together to prevent accidents in gales of wind, and the whaling "craft" was carefully stored in the warehouses. In the early days of whaling each vessel carried two boats, one of which seems to have been held in reserve in case of accident to the one lowered for whales.

In 1730 Nantucket employed in the fishery twenty-five vessels of from

"(Signed) WILLIAM CHADDER.

"Dated at Boston the 7th 4th mo. 1720."

(From original bill of lading in possession of F. C. Sanford, esq.)

* The place first settled was at Maddeket, at the west end of the island. According to the records in the state-house at Boston, the following vessels were registered as belonging to Nantucket up to the year 1714: April 28, 1698, Richard Gardner, trader, registers sloop Mary, 25 tons, built in Boston, 1694; August 11, James Coffin, trader, registers sloop Dolphin, 25 tons, built in Boston, 1697; September 1, Richard Gardner, mariner, registers sloop Society, 15 tons, built in Salem, 1695; April 4, 1710, Peter Coffin, registers sloop Hope, 40 tons, built in Boston, 1709; April 24, 1711, Silvanus Hussey, sloop Eagle, 30 tons, built at Scituate, 1711; July 30, 1713, Silvanus Hussey, sloop Bristol, 14 tons, built at Tiverton, 1711; April 27, 1713, Abigail Howse, sloop Thomas, 12 tons, built at Newport, R. I., 1713; May 4, 1714, Ebenezer Coffin, sloop Nonsuch, 25 tons, built at Boston, 1714. (The Nonsuch is registered as of Boston; Coffin, however, was of Nantucket); 1714, Geo. Coffin, sloop Speedwell, 25 tons, built at Charlestown. This, then, was the character of their vessels up to 1715; among them the Hope, of 40 tons, was a very giant.

In 1732, however, the size had very greatly increased, for by a petition (Mass. Col. MSS. Maritime, v, p. 510), it appears that Isaac Myrick built at Nantucket a snow of 118 tons.

† Macy's Hist., p. 37. According to the Boston News Letter, European advices of August 3, 1724, reported that the Emperor of Russia had ordered the directors of the India Company "newly erected there" to get twelve vessels ready against the opening

38 to 50 tons burden each, and the returns were about 3,700 barrels of oil, worth, at £7 per ton, £3,200. Holmes says:* "The whale-fishery on the North American coasts must, at this time" (1730), "have been very considerable; for there arrived in England from these coasts, about the month of July, 154 tons of train and whale oil, and 9,200 of whale bone." At this time there were nearly five hundred ships, manned by four thousand sailors, engaged in foreign traffic from Massachusetts.†

The culminating point of shore-whaling at Nantucket was probably reached in 1726. During that year there were 86 whales taken by boats, and the Coffins and Gardners, the Folgers, the Husseys, the Swains and Paddacks, the progenitors of that race of men who carried the name and fame of the little island of Nantucket to every accessible port on the globe, are chief among those who gathered this harvest.‡

The first recorded loss of a whaling-vessel from the island occurred in 1724, when a sloop, of which Elisha Coffin was master, was lost at sea with all on board.§ The second loss was that of another sloop, Thomas

---

of the spring, to sail for the Greenland whaling-ground, promising to them both protection and monopoly, "by which it will be prohibited, under severe penalties, to bring for the future any Oil or Whalebone into any Part of His Majesty's Dominions from Foreign Countries." Early in 1725 the directors of the English South Sea Company ordered 12 more ships for whaling in these seas. (The inference is that as early at least as the previous year, 1724, the company had vessels there.) Under date of London, July 24, 1725, the ships are reported all returned. The English ships took 25 whales, producing 1,000 puncheons of blubber and oil and 26 tons of fins, worth £450 per ton. In the Dutch fishery, the Hollanders, with 144 ships took 240 whales; the Hamburghers with 43 ships took 463 whales; the Bremenese with 23 ships took 29 whales; the Bergenese with 2 ships took none, and two other ships returned empty. In the spring of 1726, Sweden also looked with longing eyes upon this pursuit, and designed sending twelve ships in the summer of that year to Greenland.

* American Annals, i, p. 126.

† *Ibid.*

‡ The names of the parties (probably captains of boats or vessels), with the number of whales taken by each, may be of interest in this connection: John Swain took 4, Andrew Gardner 4, Jonathan Coffin 4, Paul Paddack 4, Jas. Johnston 5, Clothier Pierce 3, Sylvanus Hussey 2, Nathan Coffin 4, Peter Gardner 4, Wm. Gardner 2, Abishai Folger 6, Nathan Folger 4, John Bunker 1, Shaubael Folger 5, Shubael Coffin 3, Nath'l Allen 3, Edw'd Heath 4, Geo. Hussey 3, Benj. Gardner 3, Geo. Coffin 1, Rich'd Coffin 1, Nath'l Paddack 2, Jos. Gardner 1, Matthew Jenkins 3, Bartlett Coffin 4, Daniel Gould 1, Ebenezer Gardner 4, ——— Staples 1; total 86. The largest number of whales taken in one day was eleven. In the New England Weekly Journal of December 21, 1730, appears an advertisement, informing the public that there has been "Just Reprinted, The Wonderful Providence of God, Exemplified in the Preservation of William Walling who was drove out to Sea from Sandy Hook near New York in a leaky Boat, and was taken up by a Whaling Sloop & brought to Nantucket after he had floated on the Sea eight Days without Victuals or Drink." In 1732, according to a petition in the Mass. Col. MSS. (Maritime, iv, p. 510), a vessel of 118 tons burden was built at Nantucket, the ruling price being then £8 5s. per ton.

§ Zaccheus Macy, in a brief sketch of Nantucket, published in vol. iii of the Mass. Hist. Soc.'s Coll., says (p. 157) that up to 1760 no man had been killed or drowned while whaling, and this error Obed Macy, in his History of Nantucket, perpetuates. It must have been intended by the former to include only shore-whaling, since prior to the

Hathaway master, in 1731. These losses were a serious matter for a small whaling-port, where nearly all the inhabitants were related by birth or marriage. In the year 1742 still another sloop, commanded by Daniel Paddack, was lost while on a whaling-voyage, with all on board.

An increase in the business brought with it an increase in the number and size of the vessels employed. Schooners were added, and the size of the vessels increased to between 40 and 50 tons. Whales began to grow scarce in the vicinity of the shore, and still larger vessels were put into the service and sent to the "southward" as it was termed, cruising on that ground till about the first of July, when they returned, refitted, and cruised to the eastward of the Grand Bank during the remainder of the whaling season, unless, as was often the case, they filled sooner. Vessels for this service were generally "sloops of 60 or 70 tons; their crews were made up, in part, of Indians,"* there being generally from four to eight natives to each vessel.

But the time came when Nantucket did not furnish men enough to man the whaling-vessels which the islanders desired to fit out, and Cape Cod, and even Long Island, were called in to supply the deficiency of seamen. It naturally occurred that, with the limited colonial demand, the business became at times overdone, the market glutted, and what oil was sold was disposed of at too low a price to be as remunerative as the islanders thought it should be. The people began to think of another market. For a series of years they had made Boston their factor, selling there their oil and drawing from thence their supplies.† Probably

---

period named at least nine vessels with their crews had been lost, and these facts must have been well known to him. There is on file at the State-house in Boston (Domestic Relations, vol. 1, p. 181), a petition to the general court from Dinah Coffin, of Nantucket, setting forth that "her Husband, Elisha Coffin did on the Twenty Seventh Day of April Annoq Dom: 1722 Sail from sd Island of Nantucket in a sloop: on a whaling trip intending to return in a month or six weeks at most, And Instantly a hard & dismall Storm followed; which in all probability Swallowed him and those with him up: for they were never heard of." She prays that she may now (1724) be allowed to marry again.

* Zaccheus Macy writes (Mass. Hist. Soc. Coll., iii, p. 157), "It happened once, when there were about thirty boats about six miles from the shore, that the wind came round to the northward, and blew with great violence, attended with snow. The men all rowed hard, but made but little headway. In one of the boats were four Indians and two white men. An old Indian in the head of the boat, perceiving that the crew began to be disheartened, spake out loud in his own tongue and said, '*Momadichchator auqua sarshkee sarnkee pinchee eynoo sememoochkee chaquanks wihchee pinchee eynoo;*' which in English is, 'Pull ahead with courage; do not be disheartened; we shall not be lost now; there are too many Englishmen to be lost now.' His speaking in this manner gave the crew new courage. They soon perceived that they made headway; and after long rowing they all got safe on shore." In 1744 a Nantucket Indian struck a blackfish, and was caught by a foul line and carried down and drowned.—(Boston News-Letter.)

† It would be inferred that the shipment made in 1720 did not prove entirely satisfactory. The Boston News-Letter reports that Captain Churchman arrived at Portsmouth, Eng., December 8, 1729, from New England for London, with a cargo of logwood and oil.

had their oil commanded the price which they considered it should have brought, this state of affairs might long have continued, but such was not the case. "It was found," says Macy,* "that Nantucket had in many places become famed for whaling, and particularly so in England, where partial supplies of oil had been received through the medium of the Boston trade. The people, finding that merchants in Boston were making a good profit by first purchasing oil at Nantucket, then ordering it to Boston, and thence shipping it to London, determined to secure the advantages of the trade to themselves, by exporting their oil in their own vessels. They had good prospects of success in this undertaking, yet, it being a new one, they moved with great caution, for they knew that a small disappointment would lead to embarrassments that would, in the end, prove distressing. They, therefore, loaded and sent out one vessel, about the year 1745. The result of this small beginning proved profitable, and encouraged them to increase their shipments by sending out other vessels. They found, in addition to the profits on the sales, that the articles in return were such as their business required, viz, iron, hardware, hemp, sailcloth, and many other goods, and at a much cheaper rate than they had hitherto been subjected to." This naturally gave renewed life to the enterprise, and induced the fitting of new vessels and the development of new adventurers. The sky was not always fair, not every voyage proved remunerative, but the business as a whole steadily increased in importance and profit. At about this time (1746), according to Macy's History, whaling was commenced by our people in Davis's Straits.†

The transfer of the trade of Long Island to Boston and Connecticut was a source of great uneasiness to the early governors of New York. They were repeatedly stirred up on the subject by the lords of trade in England, but with all their trouble and skill and efforts they were unable to alienate the sympathies of the Long Islanders from those who were their friends both by birth and association. They had but little in common with the New York government, which seemed to them only the symbol of wrong, injustice, and oppression. The governors of that

* Page 51. The Boston News-Letter of October 5, 1738, reports from Nantucket that an Indian plot to fire the English houses and kill the inhabitants of the island, had been disclosed by a friendly Indian. In consequence of the warning the plot had been abandoned, but fears were entertained for the safety of several whaling-vessels which sailed in the spring, and of the crews, of which the natives formed an essential part.

† Page 54. Davis's Straits were visited by whalemen as early as 1732, when a Captain Atkins, returning from a whaling voyage thence, brought a Greenland bear. Captain Atkins went as far as 66° north. Among the entries and clearances at the Boston custom-house as recorded in the Boston News-Letter as early as 1737 we find several to and from this locality. Beyond a doubt these vessels are whalemen, and in fact some of the names are common in the annals of this industry at Nantucket. The clearances were usually in March or April, and the arrivals from September to November, varying according to the degree of success, the season, &c. In July, 1737, Capt. Atherton Hough took a whale "in the Straits," and in 1739, under date of August 2, the Boston News-Letter says: "There is good Prospect of Success in the *Whale Fishery to Greenland*

province were numerous and tyrannical, and the people had no redress. The boast of one of them that he would tax them so high that they would have no time to think of anything else but paying these duties, seemed to be resolved into a motto adopted by the majority, and the groanings and writhings of the people only seemed to serve as the excuse for another turn of the screws of executive tyranny.

In June, 1703, Lord Conbury, in a letter to the lords of trade,* speaking of the difficulties the commerce of New York had to contend with from the position of some parts of its territory in relation to Connecticut and Massachusetts, writes that Connecticut fills that part of Long Island with European goods cheaper than New York can, since New York pays a duty which is not assessed by Connecticut; "nor will they" (the inhabitants of the east end of Long Island) "be subject to the Laws of Trade nor to the Acts of Navigation, by which means there has for some time been no Trade between the City of New Yorke and the East end of Long Island, from whence the greater quantity of Whale-oyle comes." He adds that the people are full of New England principles, and would rather trade with Boston, Connecticut, and Rhode Island than with New York.

In 1708, however, under Lord Cornbury, an act was passed for the "Encouragement of Whaling," in which it was provided, 1st, that any Indian, who was bound to go to sea whale-fishing, should not "at any time or times between the First Day of *November* and the Fifteenth Day of *April* following, yearly, be sued arrested, molested, detained or kept out of that Imployment by any person or persons whatsoever, pretending any Contract, Bargain Debt or Dues unto him or them except and only for or concerning any Contract, *Debt* or *Bargain* relating to the Undertaking and Design of the Whale-fishing and not otherwise under the penalty of paying treble Costs to the Master of any such Indian or Indians so to be sued, arrested, molested or detained." Section 2 provided that "if any person or persons shall purchase, take to pawn or anyways get or receive any Cloathing, Gun or other Necessaries that his Master shall let him, from any such Indian or Indians or suffer any such Indian to be drinking or drunk in or about their Houses, when they should be at Sea, or other business belonging to that

this Year, for *several vessels are come in already*, deeply laden, and *others expected*." This is not mentioned as by any means an extraordinary circumstance, and when it is remembered that the English had already pursued the whale in those seas for fifteen years, and at that time had some forty or fifty ships there engaged in this pursuit, it would scarcely be likely to excite surprise.

In 1744, a whale 40 feet long was found ashore on Nantucket, by three men, who, for lack of more proper instruments, killed it with their jack-knives. (News-Letter October 4.)

* N. Y. Col. Rec. iv, p. 1058. An order was passed in the New York Council, March 2, 1702, directing Thomas Clark and John Crosier, of Suffolk County, to secure three drift whales ashore in said county, they to have one-third of the oil and bone and to deliver the remaining two-thirds to the New York custom-house clear of charge. (Council Minutes, viii, p. 323.)

Design of Whale-fishing or shall carry or cause to be carried any Drink to them, whereby such Indians are made incapable of doing their Labour and Duty in and about their Master's Service," within the date above named, shall be compelled to restore the articles taken, and forfeit to the master the sum of thirty shillings. This act was to be in force seven years after publication, but it did not finally become a law until June 10, 1710. It was renewed in 1716 for four years longer,* and again in 1720 for a further term of six years.†

In July, 1708, Lord Cornbury writes again to the board of trade regarding New York affairs.‡ In his letter he says: "The quantity of Train Oyl made in Long Island is very uncertain, some years they have much more fish than others, for example last year they made four thousand Barrils of Oyl, and this last Season they have not made above Six hundred: About the middle of October they begin to look out for fish, the Season lasts all November, December, January, February, and part of March; a Yearling will make about forty Barils of Oyl, a Stunt or Whale two years old will make sometimes fifty, sometimes sixty Barrils of Oyl, and the largest whale that I have heard of in these Parts, yielded one hundred and ten barrels of Oyl, and twelve hundred Weight of Bone."

In 1709 the fishery had attained such value on Long Island that some parties attempted to reduce it, so far as possible, to a monopoly, and grants of land previously made by Governor Fletcher and others, in a reckless and somewhat questionable manner were improved for personal benefit. Earl Bellomont, in commenting on these irregular practices, writes to the lords of trade, under date of July 2 of that year,§ citing, among others, one Colonel Smith, who, he states, "has got the beach on the sea shore for fourty miles together, after an odd manner as I have been told by some of the inhabitants * * * * * * having forced the town of Southampton to take a poore £10 for the greatest part of the said beach, which is not a valuable consideration in law, for Colonel Smith himself own'd to me that that beach was very profitable to him for whale fishing, and that one year he cleared £500, by whales taken there."

In 1716, Samuel Mulford, of Easthampton, in a petition to the King, gave a sketch of the progress of this industry in that vicinity.‖ In the recital of the grievances of his neighbors and himself, he writes that "the inhabitants of the said Township and parts adjacent did from the first Establishment of the said Colony of New York enjoy the Privilege & Benefit of fishing for whale & applying ye same to their own use as their undoubted right and property."¶ By his petition it appears further that in 1664 Governor Nicolls and council directed that drift-

§ N. Y. Col. Rec., iv, 535.

‖ N. Y. Col. Rec., v, p. 474.

¶ These are undoubtedly what the authorities were pleased to term "Massachusetts notions."

whales should pay a duty of every sixteenth gallon of oil to the government, "exempting the whales that were killed at Sea by persons who went on that design from any duty or imposition." Governor Dongan also claimed duty on drift-whales, and he also exempted those killed at sea. "There was no pretence," under Dongan, "to seize such whales or to exact anything from the fishermen on that account, being their ancient right and property. Thus the inhabitants had the right of fishing preserved to them, and the Crown the benefit of all drift Whales, and everything seemed well established between the Crown and the People, who continued chearfully, and with success, to carry on the said fishing trade." This state of affairs continued until 1696, when Lord Cornbury (afterward Earl of Clarendon) became governor. It was then announced by those in authority that the whale was a "Royal Fish," and belonged to the Crown; consequently all whalers must be licensed "for that purpose which he was sure to make them pay for, and also contribute good part of the fruit of their labour; no less that a neat 14th part of the Oyle and Bone, when cut up, and to bring the same to New York an 100 miles distant from their habitation, an exaction so grievous, that few people did ever comply for it."* The result of this policy was to discourage the fishery, and its importance was sensibly decreased. In 1711 the New York authorities issued a writ to the sheriffs, directing them to seize all whales. This demand created much disturbance, but the people, knowing no remedy, submitted with what grace they could to what they felt was a grievous wrong, and an infringement upon their rights under the patent under which their settlement was founded. Since that time, Mulford continues, a formal prosecution had been commenced against him for hiring Indians to assist him in whaling. He concludes his petition with the assertion that, unless some relief was afforded, the fishery must be ruined, since "the person concerned will not be brought to the hardship of waiting out at sea many months, & the difficulty of bringing into New York the fish, and at last paying so great a share of their profit."

Mulford, during the latter part of his life, was continually at loggerheads with the government at New York. A sturdy representative of that Puritan opposition to injustice and wrong with which the early settlers of Eastern Long Island were so thoroughly imbued, the declining years of his life were continual eras of contention against the tyrannies and exactions of governors, whose only interest seemed to be to suck the life-blood from the bodies of these unfortunate flies caught in their

*It was these outrageously unjust laws that brought the government into the notorious disrepute it attained with its outlying dependencies from 1675 to 1720. In March, 1698, the council of Lord Cornbury declared certain drift-whales the property of the Crown (which apparently meant a minimum amount to the King and a maximum share to the governor), "when the subject can make no just claim of having killed them." One Richard Floyd having offered a reward to any parties bringing him information of such whales, the council ordered an inquiry into the matter in order to prevent such practices in the future. (Council Minutes, viii, p. 6.)

spider's-net, and cast the useless remains remorselessly away. He was one of the remonstrants against the annexation of the eastern towns to the New York government, and from 1700 to 1720 was the delegate from these towns to the assembly. In 1715 the opposition of the government to his constituency reached the point of a personal conflict with him. In a speech delivered in the assembly in this year, he boldly and unsparingly denounced the authorities as tyrannical, extravagant, and dishonest. He cited numerous instances of injustices from officers of the customs to the traders of and to his section. While grain was selling in Boston at 6*s.* per bushel, and only commanding one-half of that in New York, his people were compelled by existing laws to lose this difference in value. While the government was complaining of poverty and the lack of disposition on the part of the people to furnish means for its subsistence, the governor had received, says Mulford, during the past three years, three times the combined income of the governors of Massachusetts, Rhode Island, and Connecticut. In 1716 the assembly ordered this speech to be put into the hands of the speaker, but Mulford, without hesitation, caused it to be published and circulated.* From this time forth the war upon him was, so far as the government was concerned, a series of persecutions, but Mulford undauntedly braved them all and in the end was triumphant. Quite a number of letters passed between the governor and himself, and between them both and the lords of trade in London. As an earnest of the feeling his opposition had stirred up, the governor commenced a suit against him in the supreme court, the judges of which owed their appointment to the executive. Shortly after this, Governor Hunter, in a communication to the lords of trade regarding the state of affairs in the province, writes that he is informed that Mulford, who "has continually flown in face of government," and always disputed with the Crown the right of whaling, has gone to London to urge his case.† He states that "that poor, troublesome old man" is the only mutineer in a province otherwise quiet (an assertion that evidenced either a reckless disregard for truth, or a want

* A copy of this speech is bound in an old volume of the Boston News-Letter, in the library of the Boston Athenæum.

† In the address of H. P. Hedges at the Bi-Centennial celebration at Easthampton, in 1850, he says, when Mulford finally repaired to London to present the case to the king, he was obliged to conceal his intention. Leaving Southampton secretly, he landed at Newport, walked to Boston, and from thence embarked for London. Arrived there, he "presented his memorial, which it is said attracted much attention, and was read by him in the House of Commons." He returned home in triumph, having attained the desired end. At this time he was seventy-one years old. "Songs and rejoicings," says J. Lyon Gardiner (*vide* Hedges's Address, p. 21), "took place among the whalemen of Suffolk County upon his arrival, on account of his having succeeded in getting the King's share given up." It is related of him (*Ibid.*, p. 68) that while at the court of St. James, being somewhat verdant, he was much annoyed by pickpockets. As a palliative, he had a tailor sew several fish-hooks on the inside of his pockets, and soon after one of the fraternity was caught. This incident being published at the time won for him an extensive notoriety. He was representative from Easthampton from 1715 to 1720, and died in 1725, aged eighty years.

of knowledge of affairs inexcusably culpable); that the case he pleads has been brought before the supreme court and decided against him, and Mulford is the only man who disputes the Crown's right, and the good governor charitably recommends their lordships to "bluff him."* Still later, Hunter states that it was the custom long before his arrival to take out whaling licenses. Many came voluntarily and did so. If whaling is "decayed," it was not for want of whalemen, for the number increases yearly; "but the truth of the matter is, that the Town of Boston is the Port of Trade of the People inhabiting that end of Long Island of late years, so that the exportation from hence of that commodity must in the Books be less than formerly." The perquisites arising from the sale of these licenses were of no account in themselves, but yielding in this matter would only open a gap for the disputation of ever perquisite of the government.†

To this the lords of trade reply:‡ "You intimate in your letter to our Secretary of 22d November last that the Whale fishery is reserved to the Crown by your Patents: as we can find no such thing in your Commission, you will explain what you mean by it." Mulford is now in London, and desires dispatch in the decision in regard to this matter, pending which the lords desire to know whether dues have been paid by any one; if so, what amount has been paid, and to what purpose this revenue has been applied.§ They close their letter with the following sentence, which would hardly seem open to any danger of misconstruction: "*Upon this occasion we must observe to you, that we hope you will give all due incouragement to that Trade.*" Evidently the case of Mulford *vs.* Hunter looks badly for the governor. Still, Hunter is loth to yield readily, and the discussion is further prolonged.

It is now 1718. Governor Hunter, in his answer to the inquiries of their lordships,‖ says Commission was issued giving power, "Cognoscendi de Flotsam, Jetsom, Lagon, Deodandis, &c.," follows "et de Piscibus Regalibus Sturgeonibus, Balenis Cœtis Porpetüs Delphinis Reggis, &c." In regard to the income, he again writes that it is inconsiderable; that only the danger of being accused of giving up the Crown's right would have led him to write about it. In amount, it was not £20 per annum, (corroboratory of Mulford's assertion of its decline), and as the fish had left this coast, he should not further trouble them about it. Up to the present time all but Mulford had paid and contin-

* N. Y. Col. Rec., v, 480. This assertion must be inexcusably inaccurate, for it was unquestionably on the ground of his sturdy defense of their rights that the people of Easthampton so steadily returned him to the assembly.

† N. Y. Col. Rec., v, p. 484. This admission of Hunter's of the smallness of the revenue is indisputable evidence of his incompetence, and of the truth of Mulford's assertion of the ultimate ruin of the whale-fishery under such restrictions.

‡ N. Y. Col. Rec., v, p. 501.

§ *Ibid.* It looks very much as though Mulford himself was propounding these inquiries, and their lordships' were mere mouth pieces.

‖ N. Y. Col. Rec., v, p. 510.

ued to pay. The subject appears to have been finally referred to the attorney-general, and the governor says (1719), waiting his opinion, he has surceased all demands till it comes. The question must have been left in a state of considerable mistiness, however, for in 1720 Governor Burnett informs the lords,* in a letter which indicates a satisfied feeling of compromise between official dignity and the requirements of the trade, that he remits the five per centum on the whale-fishery, but asserts the King's rights by still requiring licenses, though in "so doing he neglects his own profit," "and this," he adds, "has a good effect on the country." Under his administration the act for the encouragement of the whale-fishery was renewed.

In 1706 some of the inhabitants of Eastham and parts adjacent (including, as one of the names seems to indicate, Nantucket) presented to the general court a petition,† setting forth that the parties "whose names are hereunto subscribed, being Inhabitants of Eastham and other places thereunto adjoining, In regard all or most of us are concerned in fitting out Boats to Catch & take Whales when ye season of ye year Serves: and whereas when wee have taken any whale or whales, our Custom is to cutt them up, and to take away ye fatt and ye Bone of such Whales as are brought in, And afterwards to let ye Rest of ye Boddy of ye Lean of whales Lye on shoar in lowe water to be washt away by ye sea, being of noe vallue nor worth any Thing to us;" therefore they petition for an act of the court to permit Thomas Houghton, of Boston, or his assigns, to take and carry away all this waste, and endeavor, for the space of ten years, to put it to some profitable use, all other persons in New England to be in the mean time "forbidden, discharged, and restrained to make any further use of it than is now usually made, with a penalty on such as presume to doe it during y^t^ time without ye Consent and allowance of ye said Thom: Houghton or his Assignes." With an eye to future commercial prosperity, they allege the following reasons why the patent, if granted, will inure to their benefit: "first . . . It will cause more staves to be fetcht and brought in from other places as well as our own, and more Barrells made, and soe more Coopers will be sett at Work, with other hands to build houses for ye use of it. secondly. It will imploy our people to cutt it up, and to order it according to his direction, at such convenient houses and places as he appoints. Thirdly When tis ordered and prepared as hee or his Assignes would have it, it will implye our Sloopes to carry it to Boston, or to such places as hee or they direct, wich will be an advantage to us.

* N. Y. Col. Rec., v, p. 579. There is some discrepancy between the dates of Governor Burnett's concessions, and the triumphant reception of Mulford on his return from England, mentioned by Hedges. "In 1719, February 24," says Hedges, "a whale-boat being alone, the men struck a whale, and she, coming up under ye boat, in part staved it, and tho' ye men were not hurt with the whale, yet, before any help came to them, four men were tired and chilled, and fell off ye boat and oars to which they hung and were drowned, viz: Henry Parsons, William Schellenger, junior, Lewis Mulford, Jeremiah Conkling, junior.

† Mass. Col. MSS., Maritime, iv, pp. 72-3.

Fourthly If any Improvement can be made of it for Exportation, it will not only be of great advantage to Boston, but to many of ye Inhabitants of New England." (This is signed by Simon, Nath[ll] Coffin, John Jones.)

To this is appended a postscript, stipulating that said Houghton employ the inhabitants of the whaling towns as much as possible for his work; that he shall give the public the benefit of his discovery, if made, at the end of the ten years; and that he shall pay each whale-man "one shilling in money acknowledgment for their several shares in the Lean of the whale fishes that they shall take for the space of ten years." The postcript is signed "Sam[ll] Treat sen[r], David Mc. * * * * *, Jon[a] sparrow, Sam[ll] Knowles, Sam[ll] freeman jr, Richard * * * * , Richard Godfree."

The council granted the patent with the somewhat novel proviso: "That within the space of Four years he shew forth to the Satisfaction of the Govern[r] Council & Assembly That his Projection will take effect, *for the rayseing of Salt Petre to supply the province.*"

During the years 1724 and 1725, in the prosecution of the wars between the Indians and the colonists, some of the friendly Indians from Cape Cod were enlisted, with the express understanding that they were to be discharged in time to take part in the fall and winter whale-fishery. Accordingly, in 1724 Lieutenant-Governor Dummer, of the Massachusetts Bay, writes to Colonel Westbrook: "Upon Sight hereof you must forthwith dismiss Cpt. Bournes Comp[y] of Indians & send them hither in one of the Sloops, That so they may lose no Time for Following the Whale Fishery, w[ch] is agreeable to my Promise made to them at Enlisting."* In a postscript he adds: "Let Capt Bourne come with them to see them safe return'd." And again, in 1725, the secretary writes: "His Hon[r] Having promised the Indians enlisted by Cpt. Bourne (being all those of the County of Barnstable) to dismiss them in the Fall that so they attend their Whale Fishing; directs that you as soon as you have opportunity to send them up to Boston, in Order to their Return Home, & let none of them be detained on any Pretense whatsoever."†

Under date of March 20, 1727, the Boston News-Letter says: "We hear from the Towns on the Cape that the Whale Fishery among them has failed much this Winter, as it has done for several Winters past, but having found out the way of going to Sea Upon that Business, and having had much Success in it, they are now fitting out several Vessels to sail with all Expedition upon that dangerous Design this Spring, more (its tho't) than have ever been sent out from among them."

The same paper, in its issue of February 12, 1730,‡ contains the fol-

* Mass. Col. MSS., Letters, ii, 52.

† Mass. Col. MSS., Letters, ii, 297.

‡ On the 13th of January, 1728, says the News-Letter of February 1, there was a very severe storm at Provincetown. Several vessels were driven ashore; three or four whale boats were also destroyed, one being carried by the force of the wind up a "pretty large steep hill," and thrown upon the roof of a house on top of the hill.

lowing extract from a letter from Chatham, dated "February 6, 1729–30:" "There has been a remarkable Providence in the awful death of some of my neighbors; On the day commonly called New Year's Day, a whaleboat's Crew (which Consists of a Stersman, an Harpineer, and Four Oarmen) coming home from a Place called Hog's-Back, where they had been on a Whaling design, the Boat was overset, and all the Men lost, on a reaf of Sand that lies out against Billingsgate. When the Boat was found bottom upward, and the Stern post broken off, there were two Chests found in it, which were wedged so fast under the Thwards that the water had not washed them out; in which were found the Pocket books of two of the Men, by which it plainly appears what Boat it was; but none of the Bodies are, as yet found, that I can hear of; tho' they found an iron Pot which they had with them, upon the reaf, and discovered the Whaling Irons at the bottom of the Water, where it is about 8 feet deep.

"P. S.—Before I had done writing I had News that two of their Bodies were found."

In March, 1736, the inhabitants of Provincetown captured a large whale at sea, cut him up, and brought the blubber into that port. The estimated quantity of oil that this blubber would produce was 100 barrels.* In the News-Letter of May 27 of the same year a statement is published to the effect that on the 11th of May a whaling-sloop, of which Solomon Kenwick was master, arrived at Chatham, and reported that while on the voyage, "about forty leagues to the eastward of George's Banks, they struck and wounded two Whales, which then lay upon the Water seemingly in a dying Posture: but one of them suddenly rush'd with great Violence over the midst of one of their Boats, and sunk both the Boat and Men into the Sea; one Man was thereby kill'd outright, and two others much wounded: Tis a wonder they were not all destroy'd, for the Whale continued striking and raging in a most furious Manner in the midst of them (now in the Water) for some Time, but the other Boat came and took them all up (except the Man that was kill'd, who sunk immediately) and carried them safe to the Sloop."

The season of 1737–8 must have been an unfortunate one at Provincetown, for up to January 5, 1738, the people of that town had only killed two small whales, and some of the inhabitants took into serious consideration a change of residence.† In July, 1738, Captain Anthony Haugh, master of a whaling-vessel, took "in the Straits" a large whale, and brought him to the vessel's side to cut in. In hoisting the blubber into the hold the runner of the block gave way, by which Benjamin Hamlin, of Eastham, was killed instantly.‡ In February, 1738, the Yarmouth

* Boston News-Letter, April 1, 1736.

† Boston News-Letter. According to the News-Letter of April 21, 1737, a dozen vessels were fitting that spring from Provincetown for the Davis's Straits whale-fishery, some of them of a hundred tons burden each. So many were going on these voyages continues the account, that not more than twelve or fourteen men would be left at home.

‡ Boston News-Letter, August 31.

whalemen had killed but one large whale during the season; the bone of that one was from 8 to 9 feet long.

Nor was the whaling-season of 1738–9 any more successful to the inhabitants of the cape. Up to the 15th of February, 1739—the whaling-season being then over—there had been taken at Provincetown but six small and one large whale, and at Sandwich two more small ones. This was the extent of the catch.* As a result of two successive poor seasons, many of the people of Provincetown were in straitened circumstances and much distressed. Those depending upon the early fishing for whaling "returned as they went, only more in debt." Many were without money or provisions.†

Early in 1741 the French and Spanish privateers commenced their depredations upon the English commerce. Naturally our whaling-vessels came in for their proportion of loss. In May a Spanish privateer, under Don. Francisco Lewis, captured a whaling vessel from Barnstable, commanded by Capt. Solomon Sturgis, "Stripped the captain and eight Hands, carried away the Sloop and four Hands, and put in John Davis, Mate of said Sloop."‡ The seasons all continued unfavorable for the coast-whaling on the cape,§ but late in the summer and during the early fall of 1741 the inhabitants of that section were cheered by an unexpected success. Great numbers of porpoises and black fish came swarming into the bay, and the hardy fishermen lost no time in attacking them. By the close of October they had killed 150 porpoises and over 1,000 black fish, yielding them about 1,500 barrels of oil, for the most of which they found an immediate sale. "This unexpected Success so late in the Year, put new Life into Some who had spent all the former Season of the Year in Toil and Labour to little or no Purpose."‖

The presence of privateers on the coast appears to have entirely prevented the prosecution of the Davis Strait whaling, for no departures to or arrivals from that region are reported for several years. Whalemen were liable to be overhauled anywhere, but it is to be presumed that the risk became greater as the distance from port increased. Occasionally these privateers would swoop down through Nantucket and Vineyard Sounds

* *Ibid.* February 15.

† *Ibid.*, April 5.

‡ *Ibid.* The issue of the News-Letter for July 23, 1741, says: "Truro, July 14. On Saturday last Mr. Nath Harding an elderly Man of this Place, being at one of the Fry Houses boiling of Oil, he was taken with a fainting Fit, and fell into a large Vessell of boiling hot Oyl, and was scalded in a most miserable Manner."

§ Whales formerly, for many successive years, set in along shore by Cape Cod. There was good whaling in boats. Proper watchmen ashore, by signals, gave notice when a whale appeared. After some years they left this ground, and passed farther off upon the banks at some distance from the shore. The whalers then used sloops with whale-boats aboard, and this fishery turned to good account. At present (1748) the whales take their course in deep water, where upon a peace our whalers design to follow them. * * * * At present this business is by whaling sloops or schooners, with two whale-boats and 13 men."—(Felt, Salem, ii, 225–6.)

‖ Boston News-Letter.

and bear off whatever came in their way that they were able to take care of. Such a raid was made in the middle of the summer of 1744. One Captain Roach, in a vessel from Cape Cod, arrived in Boston and reported that on the 24th of June, just before night, being in a sloop from Nantucket for Boston, with a cargo of 330 barrels of oil, the weather being calm and his vessel somewhat in advance of the others, another sloop came up showing but few men on deck and hoisting the English flag. Captain Roach, suspecting in spite of her appearance that she was an enemy, and being only about two miles from the shore, took out the most necessary things, and, putting them into his boat, escaped with his crew to the shore. As soon as the pursuer found the sloop was abandoned, he sent a boat of armed men to her, took possession of her, and carried her off. The same vessel, which proved to be a French privateer, took in September several coasting and merchant vessels and one Nantucket whaling-vessel, and landed many of her prisoners on the island of Nantucket.*

The facts in regard to whaling at Salem and vicinity from 1700 to 1750 are very meager. Undoubtedly the business was carried on all through this section in the early part of 1700 in a small way. In 1700 John Higginson writes concerning the business there and at other portions of the coast: "We have a considerable quantitie of whale oil and bone for exportation."† Again, in 1706, he writes to a friend in Ipswich, as one concerned with others in boats engaged in whaling. Here, as elsewhere, there were drift-whales, and in 1722–'23 public‡ notices are given to claimants to prove in courts of admiralty their rights in two such cases.§ In August, 1723, a drift-whale is advertised in the Boston News-Letter as ashore at Marblehead, and the usual notice of court is appended.

Whether Boston was at this period a participant in this pursuit is difficult to determine. Various reasons tended to make that port the factor of the colony in that regard. Vessels from the whole colony cleared from there to go to the northward whaling, while those from Nantucket, the Vineyard, and the south shore of the cape pursued their southern voyages along the edge of the Gulf Stream to the Leeward and Cape de Verde Islands under clearances from Newport, R. I. In the absence of the custom-house records of Boston prior to 1776,‖ it is impossible to determine which of the numerous clearances and entries are whalemen, and equally impossible to determine to what port they belonged. Referring to the files of the colonial gazettes of this period,

* Boston News-Letter.

† Felt's Salem, ii, p. 225.

‡ *Ibid.*

§ *Ibid.*

‖ The Boston papers of December 12, 1707, state that a whale 40 feet long entered that harbor and *several whale-boats pursued and killed her* near the back of Noddle's Island. The logical inference is that they had whaling craft and boats ready for instant use and men skilled in handling them.

we find in the News Letter of September 3, 1722, an advertisement of a court of admiralty to be held to adjudicate on a drift-whale found floating near Brewster's, and towed ashore in August. It was much wasted and decayed, and in cutting it up a ball was found, indicating that it had been attacked by some party, and the advertisement notifies the public that "If any Persons can try any Claim to said Whale so as to make out a property," they should appear at the said court at Boston on the last Wednesday in the month.* On the 5th of December, 1723, "Mr. Peter Butler, of Boston," advertises for sale, "lately Imported from London, extraordinary good Whale Warps at 16*d.* a Pound, which are made of the finest Hemp, either by the Quoile or less Quantity."† In 1730 Samuel Torrey, currier, on Water street, Boston, advertises "Good Blubber by the Barrell or Tun, full Bound."

In 1731 the Rhode Island assembly passed an act for the encouragement of the whale and cod fisheries, giving "a bounty of five shillings for every barrel of whale oil, one penny a pound for bone, and five shillings a quintal for codfish, caught by Rhode Island vessels and brought into this colony * * * to be paid from the interest accruing upon a new bank, or issue bills of credit to the amount of sixty thousand pounds."‡ The whale-fishery had, according to Arnold,§ long been carried on in a small way within that colony, and whales had frequented Narragansett Bay and often been taken with boats. This bounty gave something of a stimulus to the business, and these colonists too began to "whale out into the deep," and in 1733 the first regularly equipped whaleman of which Rhode Island has any record arrived in Newport from her voyage, having on board 114 barrels of oil and 200 pounds of bone. This sloop was the Pelican, of Newport, Benjamin Thurston, owner, and she received the bounty according to the law.‖

By the inhabitants of Martha's Vineyard, in 1702–'3, there appear to have been several whales killed. The following entry occurs under that date in the court records: "The marks of the whales killed by John Butler and Thomas Lothrop. One whale lanced near or over the shoulder blade, near the left shoulder blade only; another killed with an iron forward in the left side, marked W; and upon the right side marked with a pocket-knife T. L.; and the other had an iron hole over

* Whalebone is quoted in the News-Letter of April 18, 1723, as bringing from 3*s.* to 3*s.* 6*d.* in Philadelphia.

† B. News-Letter.

‡ Arnold's Hist. of Rhode Island, ii, p. 103.

§ *Ibid.*, p. 110. In point of fact deep-sea whaling had been pursued from Rhode Island some years prior to the time mentioned by Arnold. The News-Letter for May 23, 1723, records the entry of a vessel, commanded by William Bennett, from whaling, which brought the largest sperm whale ever seen, up to that time, in those parts. It produced 18 barrels of head matter and from 40 to 50 barrels of oil, and one-third more head would have been saved had not the weather been stormy. "This spring," the account says, "our Vessels have brought in eight Whales into this port" (Newport).

‖ Arnold's R. I., ii, p. 110.

the right shoulder-blade, with two lance holes in the same side, one in the belly. These whales were all killed about the middle of February last past; all great whales, betwixt six and seven and eight foot bone, which are all gone from us. A true account given by John Butler from us, and recorded Per me, Thomas Trapp, Clerk."*

It is quite probable that deep-sea whaling did not commence at the Vineyard until about the year 1738. In that year Joseph Chase, of Nantucket, removed there, taking with him his sloop, the Diamond, of about 40 tons burden. He purchased a house and about 20 acres of land on the shores of Edgartown Harbor, erected a wharf with a try-house near, and commenced the fishery with his vessel. He followed this pursuit two or three years, till finally his ill success caused him to abandon it.

The year succeeding Chase's immigration James Claghorn purchased a small sloop of 40 tons, called the Leopard, and fitted her for the business. Two or three years' experience served to give him a distaste for it, and he sold out and retired from the contest with a loss of about $500, a large sum for those days.

In 1742 John Harper, of Nantucket, removed to the Vineyard, carrying with him the sloop Humbird, of about 45 tons. For several years he too followed whaling, in his sloop and in other vessels; but the same ill success that attended Chase and Claghorn visited also the standard of Harper, and finding himself running behind-hand year after year, he too sold out his shipping and withdrew.

Undeterred by the misfortunes of the others, John Newman, with partners, in 1744 bought the sloop Susannah, of 55 tons, and they continued nearly one year. In the fall, the corn crop on the Vineyard proving insufficient, Samuel Finley was sent in command of her to the southward for a load of that grain, and on the return passage the vessel was cast away on the Carolina coast, and with her cargo totally lost.

D.—1750 TO 1784.

NANTUCKET; MARTHA'S VINEYARD; CAPE COD; BOSTON; LONG ISLAND; RHODE ISLAND; NEW BEDFORD; WILLIAMSBURGH, &C.

The period from 1750 to 1784 was the most eventful era to the whale-fishery that it has ever passed through. For a large proportion of the time the business was carried on under imminent risk of capture, first by the Spanish and French and after by the English. The colonial Davis Strait fishery seems to have been quite abandoned, and the vessels cruised mostly to the eastward of the Grand Banks, along the edge of the Gulf Stream and in the vicinity of the Bahamas. In 1748 the English Parliament had passed a second act to encourage this fishery. By it the premium on inspection of masts, yards, and bowsprits, tar,

* For all the early information concerning Martha's Vineyard I am indebted to Richard L. Pease, esq., of Edgartown.

pitch, and turpentine, and on British-made sail-cloth were to continue, and the duties on foreign-made sail-cloth were remitted to vessels engaged in this pursuit. A bounty was also granted on all ships engaged in whaling during the then existing war; harpooners and others employed in the Greenland fishery were exempted from impressment. The commissioners of customs were, under the required certificate, to pay the second twenty shillings per ton bounty granted by Parliament over the first twenty previously granted.* The ships which had sailed during the previous March or April were to be equal sharers in this bounty with those whose sailing had been delayed. All ships built or fitted out for this pursuit from the American colonies conforming to this act were to be licensed to whale, and in order to receive the bounties must remain in Davis Straits or vicinity from May (sailing about May 1) until the 20th of August, unless sooner full or obliged to return by accident. Foreign Protestants serving in this fishery for two years, and qualifying themselves for its prosecution, were to be treated as though they were natives.† The cause of this concession to the colonies was a part of Lord Shirley's scheme to rid Acadia of the French. It was his desire that George II should cause them to be removed to some other English colony, and settle Nova Scotia with Protestants,‡ and to this end invitations were sent throughout Europe to induce Protestants to remove thither. "The Moravian Brethren were attracted by the promise of exemption from oaths and military service. The good will of New England was encouraged by care for its fisheries; and American whalemen, stimulated by the promise of enjoying an equal bounty with the British, learned to follow their game among the icebergs of the Greenland seas."§ "The New Englanders of this period," says Bancroft.‖ " were of homogeneous origin, nearly all tracing their descent to the English emigrants of the reigns of Charles the First and Charles the Second. They were a frugal and industrious race. Along the seaside, wherever there was a good harbor, fishermen, familiar with the ocean, gathered in hamlets; and each returning season saw them with an ever-increasing number of mariners and vessels, taking the cod and mackerel, and sometimes pursuing the whale into the icy labyrinths of the Northern seas; yet loving home, and dearly attached to their modest freeholds."

Of this period Hutchinson says: ¶ "The increase of the consumption of oil by lamps as well as by divers manufactures in Europe has been no small encouragement to our whale-fishery. The flourishing state of the island of Nantucket must be attributed to it. The cod and whale

¶ Hist. of Massachusetts, ii, p. 400.

fishery, being the principal source of our returns to Great Britain, are therefore worthy not only of provincial but national attention."

A continual succession of foreign wars, in which the hardy fishermen and farmers of New England were constantly called to the aid of England, coupled with a continual succession of intolerant measures adopted by the mother country toward the plantations, which, in common with the colonists at large, they felt impelled to resist, was gradually preparing America for the eventful struggle which was to end in its independence. By the experience of the wars they learned their strength, through the pressure of the tyrannical acts they learned their rights.

Pending the expedition for the reduction of Nova Scotia in 1755 an embargo was laid upon the "bank" fishermen, though the risk of capture was so great that it of itself must have quite effectively embargoed many of them.*

In 1757—the embargo being still continued upon the fishery in these waters—a petition was presented to the general court of Massachusetts from the people of Martha's Vineyard and Nantucket, representing that the memorialists "being Informed that your Honours think it not advisable to Permit the fishermen to Sail on their Voyages untill the time limited by the Embargo is Expired by Reason that their fishing banks where they Usually proceed on said Voyages lyes Eastward not far from Cape breton which may be a means of their falling into the hands of the french which may be of bad Consequence to the Common Cause. Your Memorialists would Humbly observe to Your Honours that that is not the Case with the whalemen their procedure on their Voyages is Westward of the Cape of Virginia and southward of that untill the month of June from which Your Memorialists are of the mind their is nothing like the Danger of their falling into the hands of the Cape breton Privateers as would be If they went Eastward. Your Memorialists would further Observe that the whalemen have almost double the Number of hands that the fishermen Carry which makes Their Charge almost Double to that of fishermen and ye first part of the Whale season is Always Esteemed the Principal time for their making their Voyages which If they lose the greatest part of the People will have nothing to Purchase the Necessaries of life withal they haveing no other way which must make them in miserable Situation.

"Your memorialists would therefore beg that y^r Honours would take Our Miserable Situation under Consideration and grant our Whalemen liberty to Proceed on Our Voyages from this time If it be Consistent with your Great wisdom as in duty bound shall ever pray

"ABISHAI FOLGER† (for Nantucket)"

*A duty was laid upon the colonists in 1756 to support a frigate on the Banks to defend the fishery.

†Mass. Col., MSS., Maritime, vi, p. 371. From this petition it would appear that, having an unfavorable season at the southward, the whalemen would stand for the

In compliance with the foregoing petition the Council passed this resolution (April 8, 1758): "Inasmuch as the Inhabitants of Nantucket most of whom are Quakers are by Law exempted from Impresses for military Service. And their Livelihood intirely depends on the Whale fishery—Advised that his Excell^y give permission for all whaling Vessels belong^g to s^d Il^d to pursue their Voyages, taking only the Inh^ts of s^d Island in s^d Vessells and that upon their taking any other persons whatsoever with them they be subject to all the Penalties of the law in like manner as if they had proceeded without Leave."*

In 1761 the fishery of the Gulf of Saint Lawrence and the Straits of Bellisle was opened to our whalemen, and they speedily availed themselves of its wealth. This was the legitimate result of the conquest of Canada and the cession of territory made by France to England at the conclusion of the war, a result which the colonists had labored hard and spent lives and treasure unstintedly to attain, but of the benefit of which they were destined to be defrauded. A duty was levied on all oil and bone carried to England from the colonies, and by another oppressive act of Parliament they were not allowed to find for this product any other market. The discrimination between the plantations and the mother country was made the more marked since at this time the residents of Great Britain were allowed a bounty from which the provincials were debarred. Against these injustices the merchants of New England, and those of London engaged in colonial trade, respectfully petitioned. They represented that "in the Year 1761 The Province of Massachusetts Bay, fitted out from Boston & other ports† Ten Vessels of from Seventy to Ninety Tons Burden for this Purpose. That the Success of these was such as to encourage the Sending out of fifty Vessels in the Year 1762 for the same trade. That in the Year 1763 more than Eighty Vessels were imploy'd in the same manner.‡ That they

Banks, hoping to fill there. If, however, a vessel got home early from the north, they frequently went on another voyage to the south and westward in the same year.

* Mass. Col. MSS., Maritime, vi, p. 371. Martha's Vineyard appears to be ignored in the order.

† As already explained, Boston was the port of entry for many of the Cape towns and its own immediate vicinity.

‡ According to the following doggerel there were seventy-five whaling captains sailing from Nantucket in 1763.

Whale-List, by Thomas Worth, M. 1763.

Out of Nantucket their's Whalemen seventy-five,
But two poor Worths among them doth survive:
Their is two Ramsdills & their's Woodbury's two,
Two *Ways* there is, chuse which one pleaseth you,
Folgers thirteen, & Barnards there are four
Bunkers their is three & Jenkinses no more,
Gardners their is seven, Husseys their are two,
Pinkhams their is five and a poor Delano,
Myricks there is three & Coffins there are six,
Swains their are four and one blue gally Fitch.
One Chadwick, Cogshall, Coleman their's but one,
Brown, Baxter, two & Paddacks there is three,
Wyer, Stanton, Starbuck, Moorse is four you see,
But if for a Voyage I was to choose a Stanton,
I would leave Sammy out & choose Ben Stratton.
And not forget that Bocott is alive,
And that long-crotch makes up the seventy-five.
This is answering to the list, you see,
Made up in seventeen hundred & sixty three.

have already imported to London upwards of 40 Ton of Whale Finn: being the produce of the two first years. That upon Entring of the above Finn, a Duty was required and paid upon it, of thirty one Pound ten shillings ℔ Ton. That the weight of this Duty was render'd much heavier by the great reduction made in the price of Dutch Bone since the commencement of this Trade from £500 to £330 ℔ Ton." They represent further that the reason for the conferring of bounties upon vessels in this pursuit from Great Britain was to rival the Dutch,* but in spite of this encouragement there was not enough oil and bone brought into England by British vessels to supply the demand. They also reasoned that Parliament could not intentionally discriminate between the various subjects of the Crown, granting to one a bounty and requiring of another a duty for the same service. They however ask for no bounty—they are content that Great Britain should alone receive the benefit of that—but they simply desire that they should not be taxed with a duty on these imports.†

The knowledge that the English fishery, even with its bounty, was still unable to fully cope with the Dutch, or even to supply its own home demand, as well as the desire of Earl Grenville to forward certain projects in his American policy, notably the odious stamp-tax, caused some attention to be paid to petitions similar to the foregoing, fortified somewhat by the presence of a special agent from Massachusetts to sustain the position and urge the claims there made. To various sections various tenders were to be made. "The boon that was to mollify New England," says Bancroft,‡ "was concerted with Israel Maudit, acting for his brother, the agent of Massachusetts, and was nothing less than the whale-fishery. Great Britain had sought to compete with the Dutch

* The Dutch from 1759 to 1768 sent to the Greenland fishery 1,324 ships, which took 3,018 whales, producing 146,419 barrels of oil and 8,785,140 pounds of bone. (Scoresby.) Great Britain in the same time sent about one-third the number of ships.

† Mass. Col. MSS., Maritime, vol. vii, p. 243. The concluding portion of this petition, including the signatures, is missing, a fact greatly to be regretted, as it would be extremely interesting to know who the prominent oil-merchants of that time were. The following is the statement of imports of oil and bone from the colonies into England and from Holland to the same country, which accompanied the petition:

Account of Finns & Oil from America to England & Duties from Christmas 1758 *to Christmas* 1763.

‡ Bancroft's United States, v, p. 184.

in that branch of industry; had fostered it by bounties; had relaxed even the act of navigation, so as to invite even the Dutch to engage in it from British ports in British shipping. But it was all in vain. Grenville gave up the unsuccessful attempt, and sought a rival for Holland in British America, which had hitherto lain under the double discouragement of being excluded from the benefit of a bounty,* and of having the products of its whale-fishing taxed unequally. He now adopted the plan of gradually giving up the bounty to the British whale-fishery, which would be a saving of £30,000 a year to the treasury, and of relieving the American fishery from the inequality of the discriminating duty, except the old subsidy, which was scarcely 1 per cent. This is the most liberal act of Grenville's administration, of which the merit is not diminished by the fact that the American whale-fishery was superseding the English under every discouragement. It required liberality to accept this result as inevitable, and to favor it. It was done, too, with a distinct conviction that 'the American whale-fishery, freed from its burden, would soon totally overpower the British.' So this valuable branch of trade, which produced annually three thousand pounds, and which would give employment to many shipwrights and other artificers, and to three thousand seamen, was resigned to America."

With the people of Nantucket every foreign war meant a diminution of their whaling-fleet, for there is scarcely any risk that whalemen have not and will not run in pursuit of their prey. During the years 1755 and 1756, six of their vessels had been lost at sea and six more were taken by the French and burned, together with their cargoes, while the crews were carried away into captivity. In 1760 another vessel was captured by a French privateer of 12 guns and released after the commander of the privateer had put on board of her the crew of a sloop they had previously taken nearly full of oil and burned. The captain of the sloop, ——— Luce, had sailed with three others who were expected on the coast. The day after Luce was taken, the privateer engaged a Bermudian letter of marque and was beaten. During this engagement several whalemen in the vicinity made their escape. In the same month (June) another privateer of 14 guns took several whaling-vessels, one of which was ransomed for $400, all the prisoners put on board of her, and she landed them at Newport.† In 1762 another Nantucket sloop was taken by a privateer from the French West Indies, under one Mons. Palanqua, while she was cruising in the vicinity of the Leeward Islands.

At Martha's Vineyard whaling did not seem to thrive so well as at the sister island of Nantucket. The very situation of Nantucket seemed favorable for the development of this and kindred pursuits; in fact, the situation made them necessities. While the Vineyard was quite fertile and of considerable extent, Nantucket was comparatively sterile and cir-

* The bounty of 1748 had evidently been legislated out of existence.

† These vessels were from several whaling ports.

cumscribed. At the Vineyard a livelihood could be attained from tilling the earth, at Nantucket a large portion of that which sustained life must be wrested from the ocean. A constant struggle with nature, and a constant surmounting of those obstacles incident to their location and surroundings, developed within the Nantucketois a spirit of adventure which was carefully trained into channels of enterprise and usefulness. Hence, the early history of whaling on Martha's Vineyard was not that ultimate success that it was on Nantucket, and while the year 1775 found the latter with a fleet of 150 vessels with a burden of 15,000 tons, the former at the same period could count but 12 vessels and an aggregate of 720 tons.

In 1752 Mr. John Newman and Timothy Coffin built a vessel of 75 tons, but she was also destined to a brief existence. On her second voyage whaling she was captured near the Grand Banks by the French, and Captain Coffin, her commander, lost his life, his vessel, and his cargo. In the same year (1752) John Norton, esq., with others, purchased a vessel of 55 tons for the carrying on of this business, and, like her contemporary, she failed to survive her second voyage, but was cast away on the coast of Carolina, Capt. Christopher Beetle being at the time in command. Mr. Norton immediately chartered a vessel to get his own off, but on their arrival on Carolina, his vessel was gone with her sails, rigging, and appurtenances, and he out of pocket a further sum of $500 to the wrecking party. Eight years later (1760), Esquire Norton, with others, built the sloop Polly, 65 tons burden. On her third whaling trip to the southward she too was lost, and by her destruction perished Nicholas Butler, her captain, and thirteen men. Repeated losses had reduced Norton to somewhat straitened circumstances, and, selling what property he had left, he removed to Connecticut, where he died.

It is impossible to separate in the accounts of whaling at this time the share which Boston took in it from that taken by other ports. The reports which may be found in the current papers rarely gave the name of the port to which entering or clearing vessels belonged. In fact the majority of the reports are merely records of accidents, and it is very rarely indeed that the amount of oil taken by returning whalers is given.

In 1762 a whaling-schooner commanded by ——— Bickford was totally lost on Seil (?) Islands. The crew, fourteen in number, were taken off by a fishing-vessel.*

* Boston News-Letter. It would afford an interesting study to trace the various fashions to their commencement and see if their return is marked by particular eras, or whether it is altogether spasmodic. What particularly called this to mind was reading in the News-Letter some lines addressed to a young lady's wardrobe, of which poem these four lines are appropriate here, and may serve as an illustration of the rest:

"To grace the well shap'd Foot, in Turkey's Soil,
Through Life's short Span laborious Silkworms' toil
The Whale in Zembla's frozen Region found,
That forms the swelling Hoop's capacious Round.

Of the Long Island fishery the only record accessible is the meager one regarding Sag Harbor. Easthampton, Southampton, and their more immediate neighbors seem to have been supplanted by this younger town.* Probably prior to 1760 vessels had been fitted for whaling from this port; if so, their identification is impossible. In 1760, however, three sloops were fitted out by Joseph Conkling, John Foster, and others. They were named Goodluck, Dolphin, and Success, and their cruising ground was in the vicinity of 36° north latitude.

The reports regarding Rhode Island are equally meager. Occasional reports are to be found of the arrivals of whaling-vessels, but no report of where they cruised or what success they met with, and no records exist at the custom-house to help clear up the historical mist. Warren comes into notice at this period as quite a thriving whaling-port. The Boston News-Letter of October 23, 1766, says: "Several Vessels employed in the Whale Fishery, from the industrious Town of Warren in Rhode Island Colony, have lately returned, having met with considerable success. One Vessel, which went as far as the Western Islands, brought home upwards of 300 Barrels of Oil. Some Vessels from Newport have also been tolerably successful. This Business, which seems to be carried on with Spirit, bids fair to be of great Utility to that Government."

Williamsburgh, Va., felt the stimulus caused by success in this business; and in the early spring of 1751 several gentlemen subscribed a sum of money and fitted out a small sloop, called the "Experiment," for whaling along the southern coast. On the 9th of May, 1751, she returned with a valuable whale. This was the first vessel ever fitted for this pursuit from Virginia, and whether she continued for any length of time in the business is unknown. The encouragement of the first success undoubtedly caused another venture.

In the vicinity of New Bedford whaling probably commenced but little prior to 1760. In that year William Wood, of Dartmouth, sold to Elnathan Eldredge, of the same town, a certain tract of land, located within the present town of Fairhaven, and within three-quarters of a mile of the center of the town, on the banks of the Acushnet River, "Always Excepting and reserving * * * * * that part of the same where the Try house and Oyl shed now stands." How long these buildings had been standing at the date of this deed is unknown, but the fact of their being there then is indisputable, and, as it was not the habit in those days to put up useless buildings, they were undoubtedly applied to the purpose for which they were built. That they were considered valuable property is evident from the fact of their being reserved. In 1765, four sloops, the Nancy, Polly, Greyhound, and Hannah, owned by Joseph Russell, Caleb Russell, and William Tallman, and from 40 to 60 tons burden, were employed in the whale-fishery.† In Ricketson's

* Sag Harbor was settled in 1730.

† Ricketson's History of New Bedford, p. 58. Mr. Ricketson says: "To Joseph Russell, the founder of New Bedford, is also attributed the honor of being the pioneer of the

"History of New Bedford" is published a portion of a log-book of the whaling-sloop Betsey, of Dartmouth, in 1761. The early portion is missing, the first date commencing July 27. These small vessels usually sailed in pairs, and, so long as they kept in company, the blubber of the captured whales was divided equally between them. Hence the reports, in which the captains' names are always given instead of the names of the vessels, which rarely occur, often return the vessels in pairs, with the same quantity of oil to each. The following are a few extracts from this journal as published: "August 2d, 1761. Lat. 45.54, long. 53.57. Saw two sperm-whales; killed one.—Aug. 6th. Spoke with John Clasbery; he had got 105 bbls.; told us Seth Folger had got 150 bbls. Spoke with two Nantucket men; they had got one whale between them; they told us that Jenkins & Dunham had got four whales between them, and Allen & Pease had got 2 whales between them. Lat. 42.57.—Sunday, August 9th. Saw sperm-whales; struck two, and killed them between us, (naming their consort.—August 10th. Cut up our blubber into casks; filled 35 hhds.; our partner filled 33 hhds. Judged ourselves to be not far from the Banks. Finished stowing the hold.—August 20. Lat. 44 deg. 2 min. This morning spoke with Thomas Gibbs; had got 110 bbls; told us he had spoke with John Aikin, and Ephraim Delano, and Thomas Nye. They had got no oil at all. Sounded; got no bottom. Thomas Gibbs told us we were but two leagues off the Bank." The Betsey probably arrived home about the middle of September. In 1762 she apparently made another voyage, though the journal up to the 2d of September is missing. On that date they spoke "Shubel Bunker and Benjamin Paddock." On the 3d of September they "Knocked down try-works."* On the 15th they spoke Henry Folger and Nathan Coffin.

About this time a new element entered into antagonism with colonial whaling in the Gulf of St. Lawrence and vicinity. Scarcely had the colonists aided to wrest this fishery from the French, when the English governors, in their turn, strove to keep our vessels from enjoying its benefits. In the News-Letter of August 8, 1765, is the following statement: "Tuesday one of the sloops which has been on the Whaling Business returned here. We hear that the Vessels employed in the Whale

whale-fishery of New Bedford. It is well authenticated by the statements of several cotemporaries, lately deceased, that Joseph Russell had pursued the business as early as the year 1755." From what particular portion of the then town of Dartmouth (which also included what is now known as New Bedford, and Fairhaven) he fitted out his vessels, is uncertain. At that time the land on which stands the city of New Bedford was unpopulated by the whites, and not a single house marked the spot where, within less than a century thereafter, stands the city from which was fitted out more whaling-vessels than from all the other American ports combined.

* In other words, took them down. From this it is evident that some vessels were prepared for trying out their oil on board.

The News-Letter of July 26, 1764, states that one Jonathan Negers, of Dartmouths while whaling, was so injured by a whale's striking the boat that he died a few day, after.

Fishery from this and the neighbouring Maritime Towns,* amounting to near 100 Sail, have been very successful this Season in the Gulph of St. Lawrence and Streights of Belle isle; having, tis said, already made upwards of 9,000 Barrels of Oil." But this rosy-colored report was speedily followed by another of a more somber hue. In August 22 the same paper says: "Accounts received from several of our Whaling Vessels on the Labrador Coast, are, that they meet with Difficulties in regard to their fishing, in Consequence of Orders from the Commanding Officers on that Station, a Copy of which are as follows:

"MEMORANDUM: In Pursuance of the Governor's Directions, all masters of Whaling Vessels, and others whom it may concern, are hereby most strictly required to observe the following Particulars, viz:

"1 To carry the useless Parts of such Whales as they may catch to at least Three Leagues from the Shore, to prevent the Damage that the neighbouring Fishers for Cod and Seal sustain by their being left on the Shore.

"2 Not to carry any Passengers from Newfoundland or the Labradore Coast to any Part of the Plantations.

"3 To leave the Coast by the first of November at farthest.

"4 Not to fish in any of the Ports or Coasts of Newfoundland lying between Point Richi and Cape Bonavista.

"5 Not to carry on any Trade or have any Intercourse with the French on any Pretence.

"6 In all your Dealings with the Indians, to treat them with the greatest Civility: observing not to Impose on their Ignorance, or to take Advantage of their Necessities. You are also on no Account to serve them with spirituous Liquors.

"7 Not to fish for any other than Whale on this Coast.

"Dated on board His Majesty's sloop Zephyr, at the Isle of Bois, on the Labradore Coast, the 21st July, 1765.

"JOHN HAMILTON."

The issue of November 18 reports that on account of this proclamation the vessels "are returning half loaded." It was the custom with many early whalemen, especially from the immediate vicinity of Boston, to go prepared for either cod or whale fishing, and in the event of the failure of the one to have recourse to the other. All restrictions which are sustained by an armed force are liable to be made especially obnoxious by the manner of the enforcement, and this was by no means a contrary case. It was not at all surprising then that the ensuing season's fishing was only a repetition of the failure of that of 1765. "Since our last," says the News-Letter, "several Vessels are returned from the Whaling Business, who have not only had very bad Success, but also have been ill-treated by some of the Cruisers on the Labradore Coast."

*It is impossible to apportion the vessels among their proper ports. The vessels from Cape Cod and the northward cleared at Boston; those from the Vineyard, at Nantucket; those at Dartmouth, sometimes at Nantucket and sometimes at Newport.

Two ships had been fitted out from London, the Pallisser and the Labradore, for the express purpose of trading, fishing, and whaling on the coast of Labrador and in the Straits of Belle-isle. Capt. Charles Penn, who came out in them as pilot, left the Straits on the 9th of July on his way to Newfoundland. On his passage he went on board quite a number of whaling-vessels, and reported that they had met with very poor success, had got only about twenty whales in the entire fleet. In consequence of this failure some of them had, according to the time-honored practice, gone to fishing for cod, but had been interrupted by an armed vessel and by the "company's ships" (the Pallisser and Labradore), and their catch all taken away from them save what their actual necessities required. This was done under the pretence that the whole coast was patented to "the company," and by virtue of orders issued by Hugh Pallisser, "governor of Newfoundland, Anticosti, Magdalenes, and Labradore." Pallisser's proclamation, which bore date of April 3d, 1766, specified that all British subjects whaling in that vicinity should choose places on shore where they should land, cut up their blubber, and make oil as they arrived, but not to select any place which was used in the cod-fishery. Whalemen from the plantations might take whales on those coasts, but were only permitted to land on some unoccupied place within the Gulf of St. Lawrence to cut up and try out their blubber; and it was particularly specified that they were not to make use of any place which was used by the British fishermen for the same or a similar purpose. Complaint having been made of the provincial whalemen in regard to their waste interfering with the cod fishery, they were enjoined that they must carry the carcasses of the whales at least three leagues from the shore. No fishermen from the plantations were to be allowed to winter on Labrador. And then Capt. John Hamilton, "of H. M. sloop of war Merlin, Lieut. Gov. of Labradore," &c., issued his proclamation: "This is to give Notice to all Whalers from the Plantations, that they are allowed to fish for Whales only, on the Coast of Labradore, that if they are found to have any other Fish on Board, the Fish will be seized, and they excluded the Benefit of Whale-fishery this season: and on no Pretence to trade with the Indians; whatever they shall purchase will be confiscated, and after this Notice their Vessels liable to be seized," &c., &c. Capt. Hamilton's decree bore the date of June 25, 1766.

The result of these arbitrary measures was that the whalemen left those seas and went off the banks. The close of the season witnessed the return of the whaling fleet with but indifferent success.* Naturally those interested (and this included the wealthiest merchants and the

* The Boston News-Letter mentions the arrival of Capt. Peter Wells at that port from whaling August 18, 1766. Under date of October 2, the News-Letter says: "Since our last a Number of Vessels have arrived from Whaling. They have not been successful generally. One of them viz: Capt. Clark on Thursday Morning last discovering a Spermaceti Whale near George's Banks, mann'd his Boat, and gave Chase to her,

most skillful mechanics as well as the most indefatigable mariners) felt aggrieved. It seemed scarcely in consonance with the colonial ideas of justice, crude as those notions appeared to the English nobility, that the beneficial results of a conquest which they almost single-handed had made, and for defraying the expense, of which England had declined any remuneration, should be diverted to the sole benefit of those alone who were residents of the British Isles. Merchants in London, too, whose heaviest and most profitable trade was with the provinces, joined their voices in denouncing this wrong. During the early winter the report came that Palliser's regulations were suspended until the ministry and Parliament had time to consider the subject. The matter had already, late in the last whaling season, been brought to the attention of the governor of Newfoundland, and he issued the following supplementary edict, which appeared in the Boston papers of January, 1767:

"By His Excellency Hugh Palliser, Governor and Commander in Chief in and over the Island of Newfoundland, the Coast of Labradore and all the Territories dependent thereupon:

"Whereas a great many Vessels from His Majesty's Plantations employed in the Whale-Fishery resort to that Part of the Gulph of St. Lawrence and the Coast of Labradore which is within this Government, and as I have been informed that some Apprehensions have arisen amongst them that by the Regulations made by me relating to the different Fisheries in those Parts, they are wholly precluded from that Coast:

"Notice is hereby given, That the King's Officers stationed in those Parts have always had my Orders to protect, assist and encourage by every Means in their Power, all Vessels from the Plantations employed in the Whale-Fishery, coming within this Government; and, pursuant to his Majesty's Orders to me, all Vessels from the Plantations will be admitted to that Coast on the same Footing as they have ever been admitted in Newfoundland; the ancient Practices and Customs established in Newfoundland respecting the Cod Fishery, under the Act of Parliament passed in the 10 and 11th Years of William IIId commonly called The Fishing Act, always to be observed.*

"And by my Regulations for the Encouragement of the Whale Fishers, they are also under certain necessary Restrictions therein pre-

& she coming up with her jaws against the Bow of the Boat struck it with such Violence that it threw a Son of the Captain; (who was forward ready with his Lance) a considerable Height from the Boat, and when he fell the Whale turned with her devouring Jaws opened, and caught him. He was heard to scream, when she closed her Jaws, and part of his Body was seen out of her Mouth, when she turned, and went off."

* Duties on oil imported in British ships were remitted, the commander and one-third of each crew being British. Duties were also remitted on fat, furs and tusks of seal, bear, walrus or other marine animal taken in the Greenland Seas. By other acts the imported materials to be used in outfitting were made non-dutiable and bounties were established, amounting in the final aggregate to 40*s.* per ton.

scribed, permitted to land and cut up their Whales in Labradore; this is a Liberty that has never been allowed them in Newfoundland, because of the Danger of prejudicing the Cod-Fishery carried on by our adventurers' Ships, and by Boat-Keepers from Britain, lawfully qualified with Fishing-Certificates according to the aforementioned Act, who are fitted out at a very great Risque and Expence in complying with said Act, therefore they must not be liable to have their Voyages overthrown, or rendered precarious by any Means, or by any other Vessels whatever. And

"Whereas great Numbers of the Whaling Crews arriving from the Plantations on the Coast of Labradore early in the Spring considering it as a lawless Country are guilty of all Sorts of Outrages before the Arrival of the King's Ships, plundering whoever they find on the Coast too weak to resist them, obstructing our Ship Adventurers from Britain by sundry Ways, banking amongst their Boats along the Coast, which ruins the Coast-Fishery, and is contrary to the most ancient and most strictly observed Rule of the Fishery, and must not be suffered on any Account; also by destroying their Fishing-Works on Shore, stealing their Boats, Tackle and Utensils, firing the Woods all along the Coast, and hunting for and plundering, taking away or murdering the poor Indian Natives of the Country; by these Violences, Barbarities, and other notorious Crimes and Enormities, that Coast is in the utmost Confusion, and with Respect to the Indians is kept in a State of War.

"For preventing these Practices in future Notice is hereby given, That the King's Officers stationed in those Parts, are authorized and strictly directed, to apprehend all such Offenders within this Government, and to bring them to me to be tried for the same at the General Assizes at this Place: And for the better Government of that Country, for regulating the Fisheries, and for protecting His Majesty's Subjects from Insults from the Indians, I have His Majesty's Commands to erect Block Houses, and establish Guards along that Coast.

"This Notification is to be put in the Harbours in Labradore, within my Government, and through the Favour of His Excellency Governour Bernard, Copies thereof will be put up in the Ports within the Province of Massachusetts, where the Whalers mostly belong, for their Information before the next Fishing Season.

"Given under my Hand at St. John's in Newfoundland, this First Day of August, 1766.

"HUGH PALLISER.

"By Order of His Excellency,
"JNº. HORSNAILL."

There can be scarcely a doubt but that the indiscretions of the whalemen were much magnified (if indeed they really existed) in this pronunciamento of Governor Palliser, for the sake of bolstering up the former one. The whalemen of those days were far from being the set of graceless scamps which he represents them to be. Probably there was here and there a renegade. It would be quite impossible to find in

so large a number of men that all were strict observers of the laws. Self-preservation, if no more humane motive existed, militated against the acts of which he complained. The whalemen were accustomed to visit the coast for supplies, in many cases several times a year; usually on their arrival in those parts they stood in for some portion of the coast and "wooded;" and it is hardly credible that they should wantonly destroy the stores they so much needed, or make enemies on a coast where they might at any time be compelled to land. The colonial governors quite often made the resources under their control a source of revenue for themselves, and the fact of the modification of Palliser's first proclamation only under pressure of the King and Parliament would seem to indicate personal interest in keeping whalemen from the colonies away from the territory under his control.

It is quite evident that even with this modification the colonial fishermen did not feel that confidence in the St. Lawrence and Belle Isle fishery that they felt when it was first opened to them; for a report from Charleston, S. C., dated June 19, 1767, states that on "the 22d ult. put in here, a sloop belonging to Rhode Island, from a Whaling Voyage in the Southern latitudes, having proved successful about 10 days before. *The master informs us, that near 50 New England vessels have been on the whale fishery in the same latitudes, this season, by way of experiment.*"* Over the open sea fortune-seeking governors could exercise no control, and there our seamen probably felt they could pursue their game without let or hinderance. Whales at that time abounded along the edge of the Gulf Stream, and there they continued to be found for some years, shifting their ground gradually as their fierce captors encroached more and more upon them to the vicinity of the Western and Leeward Islands, the Cape de Verdes, the Brazil Banks, and beyond. Some few whalemen, in spite of the restrictions, still visited the newly-opened fishing-ground.

The general results of the various voyages were on the whole good, and other places began to feel the stimulus of a desire to compete. Providence took part, and early in 1768 several vessels were fitted out from that port for this pursuit. New York, too, entered the lists, and Mr. Robert Murray and the Messrs. Franklin fitted a sloop for the same purpose, and she sailed on the 19th of April of that year.† The town of Newport manifested great activity.

It was currently reported in the colonies, during the early part of 1767, that the irksome restrictions upon whaling were to be entirely removed; petitions to that effect had been presented to the home government, and a favorable result was hoped for, and early in 1768 the straits of Davis and Belle Isle were again vexed by the keels of our

* Boston News-Letter.

† There seems to be no accessible report of this vessel's return, and hence the degree of success or failure of her voyage is a matter of doubt. The people of Nantucket were reported to have made £70,000 in 1767.

fishermen, as many as fifty or sixty anchoring in Canso harbor in April of that year, a few of them bound for the former locality, but the majority of them cruising in the vicinity of the Gulf of St. Lawrence and Newfoundland.* Two whaling-sloops from Nantucket, one commanded by ——— Coleman, and the other by ——— Coffin, were lost this season in the straits of Belle Isle, and the crews were saved by Captain Hamilton, of the Merlin sloop of war, who also aided them in saving the sails, rigging, and stores from the wrecks. The fishery in those parts was quite unsuccessful, many vessels, up to the last of August, having taken little or no oil.†

In 1768 there sailed from Nantucket eighty sail of vessels of an average burden of 75 tons, and probably fully as many more from other ports—Cape Cod, Dartmouth, Boston, Providence, Newport, Warren, Falmouth, (Cape Cod,) and perhaps other ports being represented, and the voyages being undertaken to Davis Straits, Straits of Belle Isle, Grand Banks, Gulf of St. Lawrence, and Western Islands. Early in the season the Western Island fleet appears to have done little, but by the middle of September they had obtained an average of about 165 barrels. The northern fleet probably did nearly as well, as numerous instances occur of vessels spoken late in the summer and in the early fall with from 100 to 150 and even as high as 200 barrels. Assuming, then, that 140 vessels returned‡ with an average produce of 150 barrels (which

* From a log-book kept by Isaiah Eldredge, of the sloop Tryall, of Dartmouth, which sailed April 25, 1768, for the straits of Belle Isle. She cleared from Nantucket, as Dartmouth was not then a port of entry. On Friday, April 29, she was at anchor in Canso Harbor, with 50 or 60 other whalemen. Saturday, May 7, left Crow Harbor and at night anchored in Man-of-War Cove, Canso Gut, "with about 60 sail of wailmen." The vessels were continually beset with ice, and on the 23d of May they cleared their decks of snow, which was "almost over shoes deep." They killed their first whale on the 22d of July. The larger number of vessels were spoken in pairs, which was the usual manner of cruising. The sloop returned to Dartmouth on the 5th of November. This log runs to 1775, and commences again in 1785, ending in 1797, with occasional breaks where leaves are cut out.

† In October, 1767, a whaling-sloop, belonging to Nantucket, arrived at the bar off that port, on board of which were four Indians, who had had some dispute at sea and agreed to settle it on their return. As the vessel lay at anchor the officers and crew—except three white men and these Indians—went ashore. The whites being asleep in the cabin, the Indians went on deck, divided into two parties, and, arming themselves with whaling-lances, commenced the affray. The two on one side were killed immediately, the other two were unhurt. The white men, hearing the affray, rushed upon deck, and, seeing what was done, secured the murderers. In November of the same year some Newburyport fishermen were astounded at perceiving their vessel hurried through the water at an alarming rate without the aid of sails. Upon investigating the cause, it was found that the anchor was fast to a whale (or *vice versa*), and the cable was cut, relieving them of their unsolicited propelling power.—(Boston News-Letter.)

‡ Of the 80 vessels sailing from Nantucket but 70 returned, the other 10 being either captured by the French or lost at sea. The same ratio is assumed for the remainder of the fleet. In 1769 a Marblehead brig, the Pitt Packet, Capt. Thos. Power, was boarded by the Rose man-of-war, for the sake of impressing men. Four of the crew, arming themselves with harpoons, retreated to the fore-peak, resolved to resist to the

was the actual average import at Nantucket)* and we have as the result of the season's fishing 21,000 barrels, worth, at £18 per ton, the ruling price, £47,200, or about $236,000.

"Between the years 1770 and 1775," says Macy,† "the whaling business increased to an extent hitherto unparalleled. In 1770 there were a little more than one hundred vessels engaged; and in 1775 the number exceeded one hundred and fifty, some of them large brigs. The employment of so great and such an increasing capital may lead our readers to suppose that a corresponding profit was realized, but a careful examination of the circumstances under which the business was carried on will show the fallacy of such a conclusion. Many branches of labor were conducted by those who were immediately interested in the voyages.‡ The young men, with few exceptions, were brought up to some trade necessary to the business. The rope-maker, the cooper, the blacksmith, the carpenter—in fine, the workmen were either the ship-owners or of their household; so were often the officers and men who navigated the vessels and killed the whales. While a ship was at sea, the owners at home were busily employed in the manufactory of casks, iron-work, cordage, blocks, and other articles for the succeeding voyage. Thus the profits of the labor were enjoyed by those interested in the fishery, and voyages were rendered advantageous even when the oil ob-

extent of their lives. In the *melée* the boarding lieutenant was killed. But three of the men, none of whom, says the News-Letter, were Americans, allowed themselves to become intoxicated, and all were captured.

* Macy's Nantucket, p. 233.

† *Ibid.*, p. 68. In the spring of 1770 three whalemen fitted out from Middletown, Conn. They returned in October of the same year, having met with very poor success.

‡ The almost universal method of settling the voyages of American whalemen was by "lays," each officer and man being shipped to receive a certain proportion of the earnings as his pay. In this way each one was directly interested in the general result. For instance, in settling the voyage of the ship Lion, of Nantucket, in 1807, the account as stated in the Coll. of the Mass. Hist. Soc., ii ser., iii vol., p. 19, is thus:

Dr.		Cr.	
To amount of charge	$362 75	By 37,358 gallons body oil	$19,766 14
To sundry accounts, clearing ship, &c., (no charge against captain, mate, and boy)	43 38	By 16,868 gallons head matter	17,849 73
		By 150½ gallons black oil	45 15
			37,661 02
The share of the captain, $\frac{1}{18}$	$2,072 13	Boy, $\frac{1}{120}$	$310 82
Mate, $\frac{1}{27}$	1,381 41	5 blacks, $\frac{1}{80}$ each	2,331 14
Second mate, $\frac{1}{37}$	1,008 06	1 black, $\frac{1}{80}$ on 400 barrels	108 36
2 ends men, $\frac{1}{48}$ each	1,554 10	1 black, $\frac{1}{90}$	414 42
5 ends men, $\frac{1}{75}$ each	2,486 55	1 black, $\frac{1}{85}$	438 80
Cooper, $\frac{1}{60}$	621 64	1 black, $\frac{1}{90}$ on all but 400 barrels	318 10

Remainder, (coming to owners,) $24,252.74.

Of the interest which those of Nantucket at home had in the success of the ship, Davis says, and with much of truth: "The cooper, while employed in making the casks, took care

tained was barely sufficient to pay the outfits, estimating the labor as a part thereof. This mode of conducting the business was universal, and has continued to a very considerable extent to the present day.* Experience taught the people how to take advantage of the different markets for their oil. Their spermaceti oil was mostly sent to England in its unseparated state, the head matter being generally mixed with the body oil,† for, in the early part of whaling it would bring no more when separated than when mixed. The whale-oil, which is the kind procured from the species called "right-whales," was shipped to Boston

that they were of sound and seasoned wood, lest they might leak his oil in the long voyage; the black-smith forged his choicest iron in the shank of the harpoon, which he knew, perhaps from actual experience, would be put to the severest test in wrenching and twisting, as the whale, in which he had a one hundredth interest, was secured; the rope-maker faithfully tested each yarn of the tow-line, to make certain that it would carry 200 pounds' strain, for he knew that one weak inch in his work might lose to him his share in a fighting monster."—(Nimrod of the Sea, pp. 48, 49.)

* 1835.

† The difference between "head" and "body" matter of the sperm whale can be best understood by reference to the following description of cutting in and diagram copied from Scammon's "Marine Mammalia:" "The first procedure after the animal is fastened to the ship, is to cut a hole through the blubber, between the eye and fin, at A, as seen in the accompanying outline sketch, then, after cutting the scarfs on each side and around the end of the first blanket-piece, a blubber-hook, attached to one of the cutting-tackles, is inserted into the hole at A, and the piece raised by means of the tackle until the whale is rolled on its side; then the line of separation between the upper jaw and junk is cut, as from L to C, and if a large whale, the line of separation is cut between the junk and case, as from B to E, and a cut is made across the root of the case from E to F; a scarf is also made around the root of the lower jaw, from near the corner of the mouth to G. A chain-strap is then put on the jaw near H and hooked or shackled to the second cutting-tackle, and raised by that purchase, while the other tackle attached to the piece is slackened off, if need be, so as to let the whale roll upon its back; when, by means of the tackle attached, and by cutting away the tongue and the adhering flesh, the jaw is wrenched from its socket and placed on deck. This being accomplished, the first tackle, which is attached to the piece, is hove up by means of the windlass, until the whale is rolled over to its opposite side, when the lines of separation are cut to correspond to those made opposite. Holes are then mortised through the head close to the upper jaw-bone, near I, at the end of the junk, near J, and at the root of the case, near K, and through these holes straps are rove, and lines are made fast to those of the junk and case. The second cutting-tackle is then hooked in the strap which is around the upper jaw at I; the fluke-chain is slackened off, and the first tackle fastened to the piece is lowered, when all hands heave on the head-tackle, forcing the whale down again, and thus bringing the creature's head up, and the body nearly to a vertical position. The officers upon the cutting-stage with their keen spades cut away between the bones and junk from L to C, and the enormous weight of the whole fatty mass of the head hanging down opens the gash between it and the skull-bone; then, cutting cross the end of the junk and root of the case, from E to F, completes the process of cutting off the head, which is temporarily made fast to the ship's quarter. The fluke-chain is then hauled in again, and the blubber is rolled from the body in the same manner as that of a baleen-whale, until coming to the region of the small, when it is unjointed just behind the vent, and the remaining posterior portion of the animal is hoisted on board in one mass. The head, as it is termed, is then hauled up to the gangway, and one of the tackles is hooked into the junk-strap at J, and by means of this cutting-tackle purchase, the head is taken in whole, if the

or elsewhere in the colonies, and there sold for country consumption, or sent to the West Indies."*

The seas continued to be infested with French and Spanish privateers and pirates,† and whalemen, especially those frequenting the ocean in the vicinity of the Western Islands, were, from the very nature of their employment, constantly liable to depredations from these corsairs, whether legalized or lawless. In March, 1771, the sloop Neptune, Captain Nixon, arrived in Newport from the mole, bringing with him portions of the crews of three Dartmouth whalemen, who had been taken on the south side of Hispaniola by a Spanish guarda coasta. These vessels were commanded by Captain Silas Butler, William Roberts, and Richard Welding. Another whaling vessel belonging to Martha's Vineyard, commanded by Ephraim Pease, was also taken at about the same time, but released in order to put on board of her the remaining prisoners. At this time Pease had taken 200 barrels of oil, and the Dart-

whale is under forty barrels; but if over that size, it is raised sufficiently out of the water to cut the junk from the case, when it is hoisted on deck. The case is then secured by one or both tackles, hove up to the plank-sheer, and an opening is made at its root, of a suitable size to admit the case-bucket, when the oil is bailed out, or the whole case is hove in on deck before being opened; which finishes the cutting-in of a sperm-whale." The "head" or case oil is, when bailed out, as clear and limpid as water, but after a short time thickens and hardens into a mass as purely white as the newly-fallen snow. The body oil is of a coarser nature. For all practical purposes, the general principles of "cutting-in" the sperm-whale will apply to the same process in regard to the right or bone whale; and for a thorough description of these cetaceans, the implements used in their capture, and the saving of the oil, the work quoted above will be found an excellent authority.

* Bancroft says (Hist. U. S., v, p. 265), in 1765 the colonists were not allowed to export the chief products of their industry, such as sugar, tobacco, cotton, wool, indigo, ginger, dyeing-woods, whalebone, &c., to any place but Great Britain—not even to Ireland. Save in the matter of salt, wines, victuals, horses, and servants, Great Britain was not only the sole market for the products of America, but the only store-house for its supplies.

This stringency must, however, have been somewhat relaxed as regards oil, for the Boston News-Letter of September 8, 1768, gives the report from London, dated July 13, that the whale and cod fisheries of New England "this season promised to turn out extremely advantageous, many ships fully laden having already been sent to the Mediterranean markets." The success of the Americans seems to have again aroused the jealousy of their English brethren, for in this same year an effort was made in Parliament to revive the bounty to English whalemen, with the intent to weaken the American fishery.

† The word "pirate" seems to have been in these days of a somewhat ambiguous signification, and was quite as likely to mean a privateer as a corsair.

mouth vessels, which were carried into St. Domingo, 100 barrels. These captures were made on the 11th of February.*

But it did not always happen that whalemen fell so easy a prey to predatory vessels. A little strategy sometimes availed them when a forcible resistance would have been out of the question, and it may be easily believed that men to whom danger and hairbreadth escapes were part of their every-day life would scarcely submit supinely when there was any chance in their favor. A notable instance of this kind occurred in April, 1771. Two Nantucket whaling-sloops, commanded respectively by Isaiah Chadwick and Obed Bunker, were lying at anchor in the harbor of Abaco, when a ship appeared off the mouth of the harbor with her signals set for assistance. With that readiness to aid distressed shipmates which has ever been a distinguishing trait of American whalemen, one of the captains with a boat's crew made up of men from each sloop hastened to render such help as was in their power. The vessel's side reached, the captain immediately boarded her to find what was desired, and much to his surprise had a pistol presented to his head by the officer in command with a peremptory demand that he should pilot the ship into the harbor. He assured the commander that he was a stranger there, but that there was a man in his boat who was acquainted with the port. The man was called and persuaded in the same manner in which the captain had been. The argument used to demonstrate the prudence of his compliance with the request being so entirely unanswerable the man performed the service, anchoring the ship where a point of land lay between her and the sloops. This being done the boat was dismissed and the men returned to their vessels. The Nantucket captains now held a consultation as to what course should be pursued. Those who had been on board the ship noticed that the men seemed to be all armed. They also observed, walking alone in the cabin, a man. The conclusion arrived at was that the ship was in the hands of pirates and that the man in the cabin was the former captain, and measures were immediately inaugurated to secure the vessel and crew. To this end an invitation was extended to the usurping captain, his officers and passengers to dine on board one of the sloops. The courtesy was accepted, and the pirate captain and his boatswain, with the displaced captain as representative of the passengers, repaired on board the sloop. After a short time he became uneasy and proposed to return to his own vessel, but he was seized by the whalemen and bound fast and his intentions frustrated. The actual captain now explained the situation, which was, that the ship sailed from Bristol (R. I.?) to the coast of Africa, from thence carried a cargo of slaves to the West Indies, and was on her return home with a cargo of sugar when the mutiny occurred, it being the intention of the mutineers to become pirates, a business at that time quite thrifty and promising. Our fishermen now told the boatswain that if he would go on board the ship and bring the former

* The men who came home with Captain Nixon were Oliver Price, Pardon Slocum, and Philip Harkins.—(Boston News-Letter.)

mate, who was in irons, and aid in recapturing the vessel, they would endeavor to have him cleared from the penalties of the law, and they prudently intimated to him that there was a man-of-war within two hours' sail from which they could obtain force enough to overpower his associates. As a further act of prudence they told him they would set a certain signal when they had secured help from the ship of war.

The boatswain not returning according to the agreement made, one sloop weighed anchor and stood toward the pirate-ship as though to pass on one side of her. As she approached the mutineers shifted their guns over to the side which it seemed apparent she would pass and trained them so as to sink her as she sailed by. But those who navigated the sloop were fully alive to these purposes, and as she neared the ship her course was suddenly changed and she swept by on the other side and was out of range of the guns before the buccaneers could recover from their surprise and reshift and retrain their cannon. On the sloop stood upon her course till they were out of sight of the ship, then tacking, the signal agreed with the boatswain was set and she was steered boldly for the corsair. As she hove in sight, the pirates, recognizing the sign, and believing an armed force from the man-of-war was on board the whaling-vessel, fled precipitately to the shore, where they were speedily apprehended on their character being known. The whalemen immediately boarded their prize, released the mate, and carried the ship to New Providence, where a bounty of $2,500 was allowed them for the capture and where the chief of the mutineers was hanged.*

About this time Dr. Benjamin Franklin, being in London, was questioned by the merchants there respecting the difference in time between the voyages of the merchantmen to Rhode Island and the English packets to New York. The variation, which was something like fourteen days, was a source of much annoyance to the English merchants, and believing the place of destination might have something to do with it, they seriously contemplated withdrawing the packets from New York and dispatching them to Rhode Island. In this dilemma they consulted Dr. Franklin. A Nantucket captain named Folger,† who was a relative of the doctor's, being then in London, Franklin sought his opinion. Captain Folger told him that the merchantmen were commanded by men from Rhode Island who were acquainted with the Gulf Stream and the effect of its currents, and in the passage to America made use of this knowledge. Of this the English captains were ignorant, not from lack of repeated warnings, for they had been often told that they were stemming a current which was running at the rate of three miles an hour, and that if the wind was light the stream would set them back faster than the breeze would send them ahead, but they were too wise to be advised by simple American fishermen, and so persevered in their own course at a loss of from two to three weeks on every trip. By

* Boston News-Letter.

† Works of Franklin, iii, p. 353. Probably Capt. Timothy Folger, a man who was prominent for many years in the history of Nantucket.

Franklin's request Captain Folger made a sketch of the stream, with directions how to use or avoid its currents, and this sketch made over a century ago is substantially the same as is found on charts of the present day. "The Nantucket whalemen," says Franklin,* "being extremely well acquainted with the Gulph Stream, its course, strength, and extent, by their constant practice of whaling on the edges of it, from their island quite down to the Bahamas, this draft of that stream was obtained of one of them, Captain Folger, and caused to be engraved on the old chart in London for the benefit of navigators by B. Franklin."

Notwithstanding this information so kindly volunteered to them, and notwithstanding the fact that the Falmouth captains were furnished with the new charts, they still persisted in sailing their old course. There is a point where perseverance degenerates into something more ignoble; it would seem as though at this date these self-sufficient captains had about attained that point.

In 1772 two whaling sloops from Nantucket, with 150 barrels of oil each, were captured by a Spanish brig and sloop off Matanzas.† In December of the same year, the brig Leviathan, Lathrop, sailed from Rhode Island for the Brazil Banks on a whaling voyage. On the 25th of January they lowered for whales, and in the chase the mate's boat (Brotherton Daggett) lost sight of the brig, but the crew were picked up at sea and brought home by another vessel.

In 1773 quite a fleet of American whalers were on the coast of Africa,‡ no less than 14 being reported as coming from that ground, and probably there were as many more of whom no report was made. One brig from Boston, while off the coast of Sierra Leone, sent a boat ashore with six men to procure water. The boat was seized and the crew all massacred by the natives. In the spring of the following year a sloop owned by Gideon Almy of Tiverton, and another belonging to Boston,

* Works of Franklin, iii, p. 364. In a note Franklin says: "The Nantucket captains, who are acquainted with this stream, make their voyages from England to Boston in as short a time generally as others take in going from Boston to England, viz, from twenty to thirty days." Quite a number of Boston packets to and from England were at this time and for many years after commanded by Nantucket men.

† In May, 1870, according to the Boston News-Letter, no less than 19 vessels cleared from Rhode Island, whaling. The Post-Boy for October 14, 1771, is responsible for the following: "We learn from Edgartown, that a vessel lately arrived there from a whaling voyage, and in her voyage, one Marshall Jenkins, with others, being in a boat which struck a whale, she turned and bit the boat in two, took Jenkins in her mouth, and went down with him; but on her rising threw him into one part of the boat, whence he was taken on board the vessel by the crew; being much bruised—and in a fortnight after, he perfectly recovered. This account we have from undoubted authority."

‡ According to Macy, (p. 54,) the following are the dates of the occupation of various fishing-grounds by Nantucket whalemen in addition to the Davis Strait fishery: Island of Disco, 1751; Gulf of Saint Lawrence, 1761; coast of Guinea, 1763; Western Islands, 1765; east of Banks of Newfoundland, 1765; coast of Brazil, 1774. According to a local tradition, the first Nantucket whaleman who "crossed the line," arrived home from his voyage on the day of the battle of Concord and Lexington. This was the brig Amazon, Uriah Bunker, commander.

were seized, while watering at Hispaniola, by a French frigate, carried into Port-au-Prince and there condemned.*

In 1774 a report came by the way of Fayal that a small American whaling brig was lying in the harbor of Rio Janeiro with only her captain and three men on board. It appears that, putting in there for refreshments,† in the summer of 1773, a portion of her crew were, "by fair or foul means," induced to ship on a Portuguese snow ‡ for a three months' whaling voyage. The snow was provided with harpoons and other whaling craft, made after the English models, and was cruising for sperm whales, a business altogether new to the Portuguese, who had been, hitherto, ignorant of any but the right whale, and had never ventured even in the pursuit of them out of sight of land. The brig still lay there in October, 1773, waiting the return of her men.§

In 1774 the whale-fishery in the colonies must have been in the full tide of success. There were probably fitted out annually at this time no less than 360 vessels of various kinds, with an aggregate burden of nearly 33,000 tons, and employing directly about 4,700 men, and indirectly an immensely greater number. Despite the depredations of French and Spanish privateers the fishery continued to flourish. The annual production from 1771 to 1775 was probably at least 45,000 barrels of spermaceti oil, and 8,500 barrels of right whale oil, and of bone nearly or quite 75,000 pounds.‖ In the various seaport towns from

* Boston News-Letter.

† Some vessels never dropped anchor in a port from the day they sailed until their return; but scurvy was very apt to manifest itself where a crew was so long deprived of fresh provisions.

‡ "A snow is a vessel equipped with two masts resembling the main and foremast of a ship, and a third small mast, abaft the mainmast, carrying a trysail. These vessels were much used in the merchant service at the time of the Revolution." (Lossing's Field Book, ii, p. 846, note.)

These statistics are from Jefferson's report, and were gathered for him by governor of Massachusetts.

which this pursuit was carried on, in Nantucket, Wellfleet, Dartmouth, Lynn, Martha's Vineyard, Barnstable, Boston, Falmouth, and Swanzey, in Massachusetts, in Newport, Providence, Warren, and Tiverton, in Rhode Island, in New London, Connecticut, Sag Harbor on Long Island, the merry din of the "yo heave ho" of the sailors was heard; the ring of the blacksmith's hammer and anvil made cheery music; the coopers, with their hammers and drivers, kept time to the tramp of their feet as round and round the casks they marched, tightening more and more the bands that bound together the vessels which should hold the precious oil; and the creaking of the blocks as the vessels unloaded their freight, or the riggers fitted them anew for fresh conquests, and the rattle of the hurrying teams as they carried off the product of the last voyage or brought the necessaries for the future one, lent their portion of animation to the scene. Everywhere was hurry and bustle; everywhere all were employed; none that thirsted for employment went away unsatisfied. If a vessel made a bad voyage, the owners, by no means dispirited, again fitted her out, trusting in the next one to retrieve the loss; if she made a profitable one, the proceeds were treasured up to offset a possible failure in some future cruise. On all sides were thrift and happiness.

But a change was near. "A cloud, at first no bigger than a man's hand," was beginning to overshadow the whole heaven of their commercial prosperity. The colonies, driven to desperation by the heartless cruelty of the mother country, prepared to stay further aggression, and resent at the mouth of the cannon and the point of the bayonet the insults and injuries that for a decade of years had been heaped upon them; and the English ministry, against the earnest entreaty of British merchants on both sides of the Atlantic, prepared also to enforce its desires by a resort to arms.*

The first industry to feel the shock of the approaching storm was the fisheries. Massachusetts, the center of this pursuit, was to the English ministers the very focus of the insurrectionary talk and action, and "the first step," says Bancroft, "toward inspiring terror was, to declare

* The colonial trade had become to many English merchants and manufacturers a matter of great importance, and the loss of it would be a serious misfortune. One of the industries which would feel the deprivation most strongly was the manufacture of cordage, of which the Americans were by far the chiefest purchasers in the English market.

Massachusetts in a state of rebellion, and to pledge the Parliament and the whole force of Great Britain to its reduction; the next, by prohibiting the American fisheries, to starve New England; the next, to excite a servile insurrection."*

Accordingly on the 10th of February, 1775, the ministry introduced into Parliament a bill restricting the trade and commerce of Massachusetts Bay, New Hampshire, Connecticut, and Rhode Island to Great Britain, Ireland, and the British West Indies, and prohibiting the colonies from carrying on any fishery on the Banks of Newfoundland or any other part of the North American coast.† "The best shipbuilders in the world were at Boston, and their yards had been closed; the New England fishermen were now to be restrained from a toil in which they excelled the world. Thus the joint right to the fisheries was made a part of the great American struggle."‡ To this bill there was a small but active and determined opposition, both in the House of Lords and House of Commons. It was urged on the part of the ministry that the fisheries were the property of England, and it was with the English government to do as they pleased with them. To this opinion the minority strenuously demurred. "God and nature," said Johnston, "have given that fishery to New England and not to Old."§ It was also argued by the friends of America that if the American fishery was destroyed the occupation must inevitably fall into the hands of the natural rivals of Great Britain. Despite the efforts of the little band the bill was received by a vote of 261 to 85, and passed through its various stages. As each phase was reached the act was fought determinedly but uselessly and hopelessly. The merchants and traders of London petitioned against it, and the American merchants secured the services of David Barclay to conduct the examination of those who were called to testify by the friends and opponents of the bill.|| "It was said, that the cruelty of the bill exceeded the examples of hostile rigour with avowed enemies; that

† Eng. Annual Reg., 1775, p. 78.

‡ Bancroft's United States, vii, p. 239.

§ *Ibid.*

|| Among the evidence given was much tending to show the importance of the colonial trade. It appeared that in 1764 New England employed in the fisheries 45,880 tons of shipping and 6,002 men, the product amounting to £322,220 16*s.* 3*d.* sterling in *foreign markets;* that all the materials used in the building and equipping of vessels, excepting salt and lumber, were drawn from England, and the net proceeds were also remitted to that country; that neither the whale nor cod fishery could be carried on so successfully from Newfoundland or Great Britain as from North America, for the natural advantages of America could neither be counteracted nor supplied; that, if the fishery was transferred to Nova Scotia or Quebec, government would have to furnish the capital, for they had neither vessels nor men, and these must come from New England; that it must take time to make the change, and the trade would inevitably be lost; and that American fishermen had such an aversion to the military government of Halifax, and "so invincible an aversion to the loose habits and manners of the people, that nothing could induce them to remove thither, even supposing them reduced to the necessity of emigration."—(Eng. Annual Reg.)

in all the violence of our most dangerous wars it was an established rule in the marine service, to spare the coast-fishing craft of our declared enemies; always considering that we waged war with nations, and not with private individuals."*

It was claimed that by the provisions of the bill much hardship must fall upon many people who were already at sea, and who from the very nature of their occupations must be innocent. "The case of the inhabitants of Nantucket was particularly hard. This extraordinary people, amounting to between five and six thousand in number, nine-tenths of whom are Quakers, inhabit a barren island, fifteen miles long by three broad, the products of which were scarcely capable of maintaining twenty families. From the only harbour which this sterile island contains, without natural products of any sort, the inhabitants, by an astonishing industry, keep an 140 vessels in constant employment. Of these, eight were employed in the importation of provisions for the island, and the rest in the whale-fishery." A petition was also presented from the English Quakers in behalf of their brethren at Nantucket, in which they stated the innocence of the inhabitants of that island, "their industry, the utility of their labours both to themselves and the community, the great hazards that attended their occupation, and the uncertainty of their gains; and shewed that if the bill passed into a law, they must in a little time be exposed to all the dreadful miseries of famine. The singular state and circumstances of these people, occasioned some attention to be paid to them. A gentleman on the side of the administration said, that on a principle of humanity he would move, that a clause should be added to the bill, to prevent the operation from extending to any whale-ships, which sailed before the 1st of March, and were at that time the property of the people of Nantucket."†

"The bill," says a reviewer of the time, "was attacked on every ground of policy and government; and with the greatest strength of language and height of colouring. The minority made amends for the smallness of their numbers by their zeal and activity. * * * * Evil principles," they contended, "were prolific; the Boston Port Bill begot this New England Bill; this will beget a Virginia Bill; and that again will become the progenitor of others, until, one by one, parliament has ruined all its colonies, and rooted up all its commerce; until the statute-book becomes nothing but a black and bloody roll of proscriptions; a frightful code of rigour and tyranny; a monstrous digest of acts of penalty and incapacity and general attainder; and that wherever it is opened it will present a title for destroying some trade or ruining some province."‡

It was during the debate upon this bill that Burke made that eloquent defense of the colonies which has rung in the ears of every boy born

* Eng. Annual Reg., 1775, p. 80.

† Eng. Annual Reg., 1775, p. 85.

‡ *Ibid.*, p. 85.

or bred in a seaport town since the day it was uttered. "For some time past, Mr. Speaker," said Burke, "has the Old World been fed from the New. The scarcity which you have felt would have been a desolating famine, if this child of your old age,—if America,—with a true filial piety, with a Roman charity, had not put the full breast of its youthful exuberance to the mouth of its exhausted parent. Turning from the agricultural resources of the Colonies, consider the wealth which they have drawn from the sea by their fisheries. The spirit in which that enterprising employment has been exercised ought to raise your esteem and admiration. Pray, Sir, what in the world is equal to it? Pass by the other parts, and look at the manner in which the People of New England have of late carried on the whale fishery. Whilst we follow them among the tumbling mountains of ice, and behold them penetrating into the deepest frozen recesses of Hudson's Bay and Davis' Straits, whilst we are looking for them beneath the Arctic Circle, we hear that they have pierced into the opposite region of Polar cold, that they are at the antipŏdés, and engaged under the frozen serpent of the South. Falkland Island, which seemed too remote and romantic an object for the grasp of national ambition, is but a stage and resting-place in the progress of their victorious industry.* Nor is the equinoctial heat more discouraging to them than the accumulated winter of both the Poles. We know that whilst some of them draw the line and strike the harpoon on the coast of Africa, others run the longitude, and pursue their gigantic game, along the coast of Brazil. No sea but what is vexed by their fisheries. No climate that is not a witness to their toils. Neither the perseverance of Holland, nor the activity of France, nor the dexterous and firm sagacity of English enterprise, ever carried this most perilous mode of hardy industry to the extent to which it has been pushed by this recent People; a People who are still, as it were, but in the gristle, and not yet hardened into the bone, of manhood. When I contemplate these things,—when I know that the Colonies in general owe little or nothing to any care of ours, and that they are not squeezed into this happy form by the constraints of a watchful and suspicious Government, but that, through a wise and salutary neglect, a generous nature has been suffered to take her own way to perfection,—when I reflect upon these effects, when I see how profitable they have been to us, I feel all the pride of power sink, and all presumption in the wisdom of human contrivances melt, and die away within me. My rigor relents. I pardon something to the spirit of liberty."

But eloquence, logic, arguments, facts availed nothing. The bill became a law. In the upper house of Parliament, where a minority fought

* At this time the Falkland Islands were the subject of considerable acrimony between the English, Spanish, and Brazilian governments. According to Freeman (Hist. Cape Cod, ii, p. 539, note), the people of Truro were the first of our American whalemen to go to the Falklands. In 1774 Captains David Smith and Gamaliel Collins, at the suggestion of Admiral Montague, of the British navy, made voyages there on that pursuit, in which they were very successful.

the bill as determinedly as the minor part of the Commons, fifteen lords entered a protest against it. The island of Nantucket was, for the reasons enumerated, relieved somewhat from its extremest features, a fact which did not escape the surveillance of the provincial authorities, who in their turn restricted the exportation of provisions from any portion of the colonies, save the Massachusetts Bay, to that island, and the Provincial Congress of Massachusetts further prohibited any exportation from that colony, save under certain regulations.* But, like the mother country, the colonies yielded to the behests of humanity and relaxed their stringency in regard to this island.

At an early day after the formal opening of the issue of battle between England and the plantations, the general court of Massachusetts passed a resolve, directing "that from and after the fifteenth Day of August instant, no Ship or Vessell should sail out of any port in this Colony, on any whaling Voyage whatever, without leave first had and obtained from the Great and General Court of this Colony, or from some Committee or committees or persons they shall appoint to grant such leave;" and on the 24th of August, the day for adjournment of the court being near at hand, it was further resolved, in view of possible damage liable to accrue to parties for want of these permits, "that the Major part of the Council for this Colony be, and they accordingly are, hereby fully impowered to grant leave for any Vessell or Vessells to sail out of any port in this Colony, on any whaling Voyage whatever, as to them shall see a fit & reasonable for the Benefit of Individuals, and the Good of the Public, provided there be good & sufficient security given that the Oil & Bone, &c., obtained on said Voyage shall be brought into some Port in this Colony, except the port of Boston, & such Permits do not interfere with any Resolve or Recommendations of the Continental Congress:—The power herein given to continue only in the recess of the general court."†

The bells that called the hardy yeomanry of New England to the defense of their imperiled liberties on the ever-memorable morning of the 19th of April rung the death-knell of the whale-fishery, save that carried on from Nantucket; the rattle of musketry was the funeral volley over its grave.‡ Save from this solitary island, it was doomed to

* Mass. Col. MSS., Provincial Congress, i, p. 300.

† Mass. Col. MSS. Rev. Council Papers, series i, vol ii, p. 17.

‡ The shipping of Nantucket rendered important ante-revolutionary aid to the colonists in the importation of powder, a service that was continued at intervals during the war. The Earl of Dartmouth, in a letter to Lieutenant-Governor Colden, dated 7th September, 1774, says: "My Information says that the Polly, Capt[n] Benjamin Broadhelp, bound from Amsterdam to Nantucket, has among other Articles received on board, no less a quantity than three Hundred thousand pounds weight of Gunpowder, & I have great reason to believe that considerable quantities of that commodity, as well as other Military Stores, are introduced into the Colonies from Holland, through the Channel of St. Eustatia." (N. Y. Col. Rec., viii, p. 487.) St. Eustatia was captured by the English during the colonial war, the chief grounds of the capture being the alleged supply to the revolting colonies of contraband goods.

annihilation. A few vessels were fitted out early in the war from other ports, but the risk was so great and the necessity so small that the business was soon abandoned. With Nantucket it was simply a case of desperation; the business must be carried on, or the island must be depopulated; starvation or removal were the only alternatives of inaction. The receipt of the news of the battle at Lexington and Concord, glorious as it was to the colonies at large, and glorious as it may have been to the islanders whose religious principles were not rigidly opposed to war in any form and under any circumstances, was to the majority of the inhabitants the announcement of ruined fortunes, annihilated commerce, misery, privation, and suffering. Without the immediate circle of colonial assistance, knowing that they were cut off from aid in case they were attacked, open to and defenseless at all sides from the predatory raids of avowed enemies and treacherous, pretended friends, the only course left open to them to adopt was to be as void of offense as possible and strive to live through the desperate struggle just about to commence. Some of the people removed to New York and eventually established the whale-fishery there. Some removed to North Carolina and there formed a community remarkable for thrift and hospitality; but the vast majority preferred to link their fortunes with those of their island home, and with her sink or swim. Vessels from abroad turned their prows toward home and speeded on their way, hoping to attain their port before English armed vessels could intercept them; those already arrived were most of them stripped of their sails and rigging and moored to the crowded wharves or run high and dry ashore.

The petitions of parties for permission to fit out their vessels for whaling were almost invariably complied with by the general court, bonds being given in about £2,000 that the cargo should be landed at some port in the colony, excepting Boston or Nantucket.*

In 1776 the Continental Congress endeavored to induce France to en-

* The following is the form of the bond:

"Know all men by these presents that Nathaniel Macy & Rich^{d} Mitchell Jr both of Sherburn in the County of Nantucket, are holden & stand firmly bound unto Henry Gardner Esq of Stowe in the County of Middlesex Treasurer of the Colony of the Massachusetts Bay or his Successors in s^{d} office in the Lawful & Just sum of Two thousand pounds to the which payment well & truly to be made we bind ourselves our Heirs Exec' or Administrators, firmly by these presents sealed wth our seal Dated this fourteenth day of September Anno Dom: 1775.

"The Condition of this obligation is such that whereas the above-said Nathaniel Macy is about to Adventure to sea on a whale Voyage the schooner Dighton Silas Paddack Master—if then the s^{d} Silas Paddack or any other person who may have the Command of s^{d} schooner Dighton, during s^{d} Voyage shall well & truly bring or Cause to be brought into some port or harbour of this Colony except the port of Boston or Nantucket all the oil & whale Bone that shall be taken by s^{d} schooner Dighton in the Course of s^{d} Voyage & produce a Certificate under the hands of the Selectmen of s^{d} Town Adjoining to such port or harbour that he there Landed ye same then the

gage in war against England, but in the proposed negotiations the fisheries on the banks of Newfoundland and the various gulfs and bays of North America were to be understood as not open to a question of division. Spain, too, was applied to. "The Colonies," says Bancroft, "were willing to assure to Spain freedom from molestation in its territories; they renounced in favor of France all eventual conquests in the West Indies; but they claimed the sole right of acquiring British Continental America and all adjacent islands, including the Bermudas, Cape Breton, and Newfoundland. It was America and not France which first applied the maxim of monopoly to the fisheries. The King of France might retain his exclusive rights on the banks of New Foundland, as recognized by England in the treaty of 1763, but his subjects were not to fish 'in the havens, bays, creeks, roads, coasts, or places,' which the United States were to win."*

In the mean time how was England affected by her American policy? The colonial fishery being abolished, it became essential that something should be done to replace it, "and particularly to guard against the ruinous consequences of the foreign markets, either changing the course of consumption or falling into the hands of strangers, and those perhaps inimical to this country. The consumption of fish-oil as a substitute for tallow was now become so extensive as to render that also an object of great national concern; the city of London alone expending about £300,000 annually in that commodity."† The evidence taken on behalf of the ministry in support of their restraining-bill, tending to show that there already existed sufficient capital in ships, men, and money for the immediate and safe transfer of the whale fishery to England, while well enough for partisan purposes, was not considered so reliable by the parties bringing it forward, and the government was not at all desirous or willing to risk a matter of such extreme importance upon the testimony there given.

Measures were accordingly taken to give encouragement to this pursuit to the fishermen and capitalists of Great Britain and Ireland.‡ The committee having the subject in charge were of the opinion that a bounty should extend to the fisheries to the southward of Greenland

above Obligation to be Void & of none Effect otherways to stand and remain in full force & virtue.

‡ Speech of the Earl of Harcout to the Irish Parliament, October 10, 1775.

and Davis Straits, and at the same time that the duties on oil, blubber, and bone, imported from Newfoundland, should be taken off. It was found that the restraining bill worked serious damage to the people of Newfoundland, and also to the fisheries from the British islands to that coast, as, in order to prevent absolute famine there, it was necessary that several ships should return light from that vicinity in order to carry cargoes of provisions from Ireland to the sufferers there.*

The English fishery, even under the encouragement given, did not, however, answer the expectations or hopes of its friends. It was not so easily transferred as had been imagined. A few more vessels sailed from Great Britain, employing, of course, a few more men, but the extra supply was a mere trifle in comparison to the deficiency that the restraining bill had caused.

The colonies, in turn, passed a bill cutting off supplies to the English fleet from the plantations,† a course entirely unforeseen by the sage adherents of the British bill. As a natural consequence, the fishery, which promised so well on paper, and upon which the majority in Parliament had founded so many hopes, failed to yield them the solace for the evil done to America that they so fondly anticipated. Many ships, instead of bearing to England supplies, only returned there for provisions to relieve the distress they found on the coast, both on the sea and the land. Indeed, it was estimated that the colonial restraining act caused a loss to England in the fishery in these parts alone of fully half a million of pounds sterling.‡ To add to the calamities caused by man, the very elements seemed combined against them, for a terrible storm arose, and the center of its fury was the shores and banks of Newfoundland. "This awful wreck of nature," says a chronicler of the time, "was as singular in its circumstances as fatal in its effects. The sea is said to have risen 30 feet almost instantaneously. Above seven hundred boats, with their people, perished, and several ships, with their crews. Nor was the mischief much less on the land, the waves overpassing all mounds, and sweeping everything before them. The shores presented a shocking spectacle for some time after, and the fishing-nets were hauled up loaded with human bodies."§ These misfortunes the opposers of the bill attributed to the vengeance of an indignant Providence.

But Parliament went further than this, and added to the atrocity of this measure another none the less barbarous. It was decreed that all those prisoners who should be taken on board of American vessels should be compelled, without distinction of rank, to serve as common

* Annual Reg., 1776, p. 131.

† The "Restraining" bill.

‡ Eng. Annual Reg., 1776, p. 49.

§ English Annual Reg., 1776, p. 43. There was also much distress at the Barbadoes. It was thought at one time to draw supplies for beleaguered Boston from these islands, but cut off as they were from supplies from the colonies, with 80,000 blacks and 20,000 whites to feed, the project was deemed in the highest degree dangerous.

sailors on British ships of war. This proposed measure was received with great indignation by those gentlemen in Parliament whom partisan asperity had not blinded to every feeling of justice to or compassion for the colonies. The clause in the bill which contained this provision was "marked by every possible stigma," and was described by the Lords, in their protest, as "*a refinement in tyranny*" which, "*in a sentence worse than death, obliges the unhappy men who shall be made captives in this predatory war to bear arms against their families, kindred, friends, and country; and after being plundered themselves, to become accomplices in plundering their brethren.*"* And, by the articles of war, these very men were liable to be shot for desertion.

By the action of this measure large numbers of Nantucket whaling captains with their crews and a few from other ports were captured by the English, and given their choice either to enter the service of the King in a man-of-war or sail from an English port in the same pursuit to which they had become accustomed.† In September (13th,) 1779, John Adams, writing from Braintree‡ to the council of Massachusetts, says: "May it please your Honours:§ While I resided at Paris I had an opportunity of procuring from London exact Information concerning the British Whale Fishery on the Coast of Brazil, which I beg Leave to communicate to your Honours, that if any advantage can be made of it the opportunity may not be lost.

"The English, the last year and the year before, carried on, this Fishery to very great advantage, off of the River Plate, in South America in the Latitude Thirty five south and from thence to Forty, just on the edge of soundings, off and on, about the Longitude sixty five, from London. They had seventeen vessells in this Fishery, which all sailed from London, in the Months of September and October. All the officers and Men are Americans.

"The Names of the Captains are, Aaron Sheffield of Newport, ———, Goldsmith‖ and Richard Holmes from Long Island, John Chadwick, Francis May,¶ Reuben May,** John Meader, Jonathan Meader, Elisha

Clark, Benjamin Clark, William Ray, Paul Pease, Bunker Fitch, Reuben Fitch, Zebbeedee Coffin * and another Coffin, ——— Delano,† Andrew Swain, William Ray, all of Nantucket, John Lock, Cape Cod;‡ four or five of these vessels went to Greenland. The fleet sails to Greenland, yearly, the last of February or the Beginning of March. There was published, the year before last, in the English Newspapers, and the same Imposture was repeated last year, and no doubt will be renewed this, a Letter from the Lords of Admiralty to Mr. Dennis De Beralt, in Colman street, informing, him that a Convoy should be appointed to the Brazil Fleet. But this, I had certain Information, was a Forgery calcutelad mainly to deceive American Privateers, and that no Convoy was appointed, or did go with that Fleet, either last year, or the year before.

"For the Destruction or Captivity of a Fishery so entirely defenceless, for not one of the Vessells has any arms, a single Frigate or Privateer of Twenty-four, or even of Twenty guns, would be sufficient. The Beginning of December, would be the best Time to proceed from hence, because the Frigate would then find the Whaling Vessells nearly loaded. The Cargoes of these Vessells, consisting of Bone and Oyl, will be very valuable, and at least four hundred and fifty of the best kind of seamen would be taken out of the Hands of the English, and might be gained into the American service to act against the Enemy. Most of the officers and Men wish well to this Country, and would gladly be in its service if they could be delivered, from that they are engaged in. *Whenever an English Man of war, or Privateer, has taken an American Vessell, they have given to the Whalemen among the Crew, by order of Government, their Choice, either to go on Board a Man of war, and fight against their Country or go into the Whale Fishery. Such Numbers have chosen the latter as have made up the Crews of these seventeen Vessells.*§

"I thought it my Duty to communicate this Intelligence to your Honours, that if so profitable a Branch of Commerce, and so valuable a Nursery of Seamen, can be taken from the English it may be done. This State has a peculiar Right and Interest to undertake the Enterprise, as almost the whole fleet belongs to it. I have the Honour to be, with the highest Consideration, your Honours most obedient & most humble servant

"JOHN ADAMS."

This letter was referred to a committee who reported that a copy of it should be sent to the President of the Continental Congress, which report was adopted, and thus Massachusetts let slip through her fingers the identical golden opportunity which the General Government had neglected the year before. The suggestions of Mr. Adams, who of all our revolutionary statesmen seems most to have understood and appre-

ciated the importance of this industry, were practically disregarded.* It is difficult to calculate how much the American whale-fishery was affected by this failure to act on this suggestion of Mr. Adams. Many of these captains and men, and others captured at other times during the war, had at its close sailed so long from British ports that the extraordinary inducements held out by the English, and the depression in their business in the United States, immediately succeeding the close of the war, operated to transfer to that country their skill and, measurably, their capital.

In the years 1778–'79 the English navy made several forays upon the sea-coast towns of New England, destroying much property at Warren, R. I., Dartmouth, Martha's Vineyard, and Nantucket in Massachusetts.† Indeed, these predatory raids were frequent throughout the war, and liable to occur at any time, consequently the unfortunate inhabitants were kept in a continual ferment. During the same time the government of France was continually intriguing for the exclusive possession of the North American fisheries. On the 6th of February, 1778, a treaty of amity and commerce was arranged between France and the United States. Upon this point each side was to retain the exclusive right to its own. The Americans conceded to the French the rights reserved by the treaties of Utrecht‡ and Paris,§ even to the French interpretation of them, which were the right to fish upon the Banks, and the exclusive use of one-half the shores of Newfoundland upon which to dry their

* An exception to the general apathy in this respect occurred late in the fall or early in the winter of 1776, when boats from the Alfred, man-of-war, were sent ashore at Canso and destroyed the whaling interest there, burning all the materials for that industry, together with all the oil stores with their contents.

† "Return of vessels and stores destroyed on Acushnet River the 5th of September, 1778: 8 sail of large vessels, from 200 to 300 tons, most of them prizes; 6 armed vessels, carrying from 10 to 16 guns; a number of sloops and schooners of inferior size, amounting in all to 70, besides whale-boats and others; amongst the prizes were three taken by Count D'Estaign's fleet; 26 store-houses at Bedford, several at McPherson's Wharf, Crans Mills, and Fairhaven; these were filled with very great quanti ies of rum, sugar, melasses, coffee, tobacco, cotton, tea, medicines, gunpowder, sail-cloth, cordage, &c.; two large rope-walks.

"At Falmouth, in the Vineyard Sound, the 10th of Septembe , 1778: 2 sloops and a schooner taken by the galleys, 1 loaded with staves; 1 sloop burnt.

"In Old Town harbour, Martha's Vineyard: 1 brig of 150 tons burden, burnt by the Scorpion; 1 schooner of 70 tons burden, burnt by ditto; 23 whale-boats taken or destroyed; a quantity of plank taken.

"At Holmes's Hole, Martha's Vineyard: 4 vessels, with several boats, taken or destroyed; a salt-work destroyed, and a considerable quantity of salt taken."—(Ricketson's New Bedford, p. 282.)

At Sag Harbor, L. I., property was taken or destroyed to a large amount; Newport suffered greatly; Nantucket lost twelve or fourteen vessels, oil, stores, &c., to the value of £4,000 sterling. Warren, R. I., suffered during the war to the extent of 1,090 tons of shipping, among them two vessels loaded with oil, and a large amount of other property. Sag Harbor also lost one or more vessels by capture.

§ February 10, 1763.

fish.* In regard to what disposition should be made of that island in case it should be captured, nothing was said; the sentiment of New England, however, upon that point was unmistakable. Later in the same year Samuel Adams, in a letter from Philadelphia, wrote: "I hope we shall secure to the United States, Canada, Nova Scotia, Florida too, and the fishery, by our arms or by treaty." He writes further, and every year of the past century has borne witness to the soundness of his views: "*We shall never be on a solid footing, till Great Britain cedes to us, or we wrest from her, what nature designs we should have.*†

France also sought the aid of Spain, and that power was given to understand that in the final treaty of peace between the United States and England, they, too, would necessarily have some voice. Vergennes, in October (1778) stated, as the only stipulations which France would require, that in the final negotiations the treaty of Utrecht must be either wholly continued or entirely annulled; that she must be allowed to restore the harbor of Dunkirk; and that she must be allowed "the coast of Newfoundland, from Cape Bonavista to Cape St. John, with the exclusive fishery from Cape Bonavista to Point Riche."‡ By a treaty made with Spain, April 12, 1779, France bound herself to attempt the invasion of Great Britain or Ireland, and to share only with Spain the North American fisheries, in case she succeeded in driving the English from Newfoundland.

These discussions (as to the terms to be embraced in the final treaty of peace) were necessary pending the question of an alliance with France and Spain against England. When the subject of frontiers was brought up, France, while yielding all claim to the provinces of Canada and Nova Scotia, which for years had been hers, joined heartily with Spain in opposing the manifest desire of the Americans to secure them. Two States persisted in the right and policy of acquiring them, but Congress, as a body, deferred to the French view of the subject. "With regard to the fisheries, of which the interruption formed one of the elements of the war, public law had not yet been settled. By the treaty of Utrecht, France agreed not to fish within thirty leagues of the coast of Nova Scotia; and by that of Paris, not to fish within fifteen leagues of Cape Breton. Moreover, New England at the beginning of the war had, by act of Parliament, been debarred from fishing on the banks of Newfoundland * * * *. "The fishery on the high seas," so Vergennes expounded the law of nations, "is as free as the sea itself, and it is superfluous to discuss the right of the Americans to it. But the coast-fisheries belong of right to the proprietary of the coast. Therefore the fisheries on the coasts of Newfoundland, of Nova Scotia, of Canada, belong exclusively to the English; and the Americans have no

* Bancroft's U. S., ix, 481. The fact must be kept in mind that whaling and fishing for cod were both carried on on nearly the same waters and often by the same vessels.

† Bancroft's U. S., x, 177.

‡ Bancroft's U. S., x, p. 184.

pretension whatever to share in them.'* In vain the United States urged that the colonies, almost exclusively, had improved the coast-fisheries, and considered that immemorial and sole improvement was practical acquisition. In vain they insisted that New England men, and New England money, and New England brains had effected the first conquest of Cape Breton, and were powerful aids to the subsequent conquest of Nova Scotia and Canada, and hence they had acquired at least a perpetual joint propriety. To their arguments Vergennes replied that the conquests were made not for the colonies but for the crown, and when New England dissolved its allegiance to that crown she renounced her right to the coast-fisheries. In the end the United States were obliged to succumb; they had asked aid from foreign powers, and they must yield so far as was practicable to the demands those powers made. These concessions were a portion of the price of independence.

A committee† was appointed by Congress to definitely arrange upon what terms the future treaty of peace with England should be finally consummated, and in February, 1779, they reported that Spain manifested a disposition to form an alliance with the United States, hence independence was an eventual certainty. On the question of fishing they reported that the right should belong properly to the United States, France, and Great Britain in common. This portion of the report was long under discussion in Congress, and it was finally voted that the common right of the United States to fish "on the coasts, bays, and banks of Newfoundland and Gulf of St. Lawrence, the Straits of Labrador, and Belleisle should in no case be given up."‡ Under a vote to reconsider this subject on the 24th of March, Richard Henry Lee proposed that the United States should have the same rights which they enjoyed when subject to Great Britain, which proposition was carried by the votes of Pennsylvania, Delaware, and the four New England States, New York and the Southern States opposing. New York, under the leadership of Jay and Morris, peremptorily declined to insist on this right by treaty, and Morris moved that independence should be the sole condition of peace. This was declared out of order by the votes of the New England States, New Jersey, and Pennsylvania, against the unanimous vote of New York, Maryland, and North Carolina; Delaware, Virginia, and South Carolina being equally divided.

But France had a vital interest in this matter, and the French minister interposed his influence, and on the 27th of May Congress returned to its original resolve, "that in no case, by any treaty of peace, should the common right of fishing be given up."

On the 19th of June the equanimity of the French minister was suddenly and rudely disturbed by Elbridge Gerry, who, being from Marble-

‡ Bancroft's U. S., x, p. 213.

head, was the steady and persistent champion of the claims of New England, and who, in the prolonged discussions, always came to the front in defense of those rights. Entirely unexpectedly, Gerry, avoiding "a breach of the rules of Congress by a change in form, moved resolutions, that the United States have a common right with the English to the fisheries on the banks of Newfoundland, and the other fishing-banks and seas of North America. The demand was for no more than Vergennes confessed to belong to them by the law of nations; and Gerry insisted that unless the right received the guarantee of France, on the consent of Great Britain, the American minister should not sign any treaty of peace without first consulting Congress."* A most stormy and bitter debate ensued. The friends of France resisted strenuously. Four States declared if the resolution was adopted they should secede. The matter, however, was somewhat compromised and the common right of fishing on the Grand Banks affirmed; Congress asking for that right the guarantee of France by means of a supplementary article explanatory of former treaties.

The French minister became alarmed, and sought an interview with the President of Congress and two other members known to be equally favorably disposed to the policy he represented. The vigor and zeal with which New England had pressed the matter had disposed them to concede to the desires of this section. He assured them "that disunion from the side of New England was not to be feared, for its people carried their love of independence even to delirium," and continued: "There would seem to be a wish to break the connection of France with Spain; but I think I can say that, if the Americans should have the audacity to force the King of France to choose between the two alliances, his decision would not be in favor of the United States; he will not certainly expose himself to consume the remaining resources of his kingdom for many years, only to secure an increase of fortune to a few shipmasters of New England. I shall greatly regret on account of the Americans, should Spain enter into war without a convention with them." Five hours of discussion failed to induce the members to undertake to change the views of Congress, and a new interview was held on the 12th of July, between Gerard and Congress, in a committee of the whole. As a final result the question was left to be settled, when a treaty of peace was formally arranged with Great Britain.†

In the mean time how fared it with the whale-fishery? The people of Nantucket, with whom alone it was still encouraged, though in the face of the most terrible discouragements, were reduced to the severest straits. To live, they must eat; to eat, they must have provisions; to obtain provisions, they must give in exchange money or its equivalent; to obtain the exchangeable commodity, some business must be pursued. The whale-fishery was the only business available to them. Long prac-

* Bancroft's U. S., x, pp. 216 to 219.

† Bancroft's U. S., x, p. 219.

tice had made them familiar with it, and a singleness of pursuit had kept them comparatively ignorant of any other occupation. But the great problem was how to carry it on, even in the limited way to which, by the destruction of their vessels, they were restricted. If they sailed under American protection, the English captured and destroyed their vessels and imprisoned their men; if they cleared with the sanction of English safeguards, the Americans performed for them the same kindly offices. Between the upper and the nether millstones of war they were quite ground to powder. In their extremity they learned that the English were inclined to be lenient toward them in the matter, and they had quite reliable assurance that the leading men of the American Government looked compassionately upon the distressed situation of the unfortunate islanders.

Influenced by these considerations, the inhabitants sent Timothy Folger, esq., to New York, to represent the condition they were in, and solicit permission to carry on whaling without danger of capture from British cruisers. They asked permits for twenty fishing-boats to fish around the island, for four vessels to be employed in the whale-fishery, for ten small vessels to supply the inhabitants with wood, and for one to go to New York for some few supplies not obtainable elsewhere.* Their petition was not so successful as they had wished.

In 1781 Admiral Digby succeeded Admiral Arbuthnot in the command of the English fleet in these waters, and permission to whale was asked of him,† and permits were issued for twenty-four vessels to pursue the business unmolested by English armed cruisers.‡ "This privi-

* Macy, 113.

† Mr. Macy gives us to understand that no permits were granted, but this must be an error; for Mr. Rotch (*vide* MS.), who was one of the committee the succeeding year to obtain grants from the English, mentions an accusation made by Commodore Affleck, of abuse of confidence in regard to the permits which were granted the year before, and that scarcely a vessel could be found but had one of these documents. To this Mr. Rotch replied: "Commodore Affleck, thou hast been greatly imposed upon in this matter. I defy Capt. ——— to make such a declaration to my face. Those Permits were put into my hands. I delivered them, taking receipts for each, to be returned to me at the end of the voyage, and an obligation that no transfer should be made or copies given. I received back all the Permits except two before I left home, and should probably have received those two on the day that I sailed. Now if any duplicity has been practiced, I am the person who is accountable, and I am here to take the punishment such perfidy deserves." Mr. Rotch's character as a man and a merchant stood too high to be questioned, and the commodore, who a moment before was so violent, became more genial, and replied, "You deserve favor," and assisted Mr. Rotch to obtain it. The termination of this difficulty is but one example of the manner in which all these slanders, from both English and Americans, were disposed of when the accused could have an opportunity of confronting the accusers or those in authority.

‡ The following is a copy of one of these permits, from Macy, p. 115:

"[L. S.] By Robert Digby, Esquire, Rear Admiral of the Red, and Commander-in-chief, &c., &c.

"Permission is hereby given to the Dolphin brig, burthen sixty tons, Walter Folger owner, navigated by Gilbert Folger as master and the twelve seamen named in the

lege," says Macy, "seemed to give new life to the people. It produced a considerable movement in business, but the resources of the island had so diminished, that but a small number of vessels could take the benefit of these permits. Those who had vessels, and were possessed of the means, fitted them out on short voyages, and, had there been no hinderance, it is probable that they would have done well; for the whales, having been unmolested for several years, had become numerous, and were pretty easily caught. To carry on the whale-fishery under permission of the government of Great Britain was a proceeding somewhat novel, and could not pass unnoticed. Although it was not publicly known, yet it was generally believed that some kind of indulgence had been shown by the enemy to the people of Nantucket. This caused some clamor on the continent; but our Government well knew the situation of the place, and its large participation in the calamities of the war, and was, consequently, rather inclined to favor than to condemn he acceptance of favors from the English. Although the Governmentt could not grant an exclusive privilege to any particular part of the Union, yet such encouragement was given by the leading men of the nation, in their individual capacity, as to warrant the proceeding. Several vessels whaling under these permits were taken by American privateers and carried into port, but in every instance they were soon liberated. Whenever it was found that the permits were used for no other purpose than that for which they had been granted, and that the vessels using them had not been engaged in illicit trade, there was no hesitation in releasing them."

Nevertheless a great risk attended this mode of proceeding, and the islanders became satisfied that to make the business reasonably safe permits must be obtained from both contending powers and permission also to make use of each license against the other's vessels of war. Accordingly, a town meeting was convened on the 25th of September, 1782, and a memorial prepared and adopted which was sent to the general court of Massachusetts.* This petition recited the unfortunate situa-

margin, to leave the island of Nantucket and to proceed on a whaling voyage,—to commence the first of January, 1782, and end the last day of ——— following, provided that they have on board the necessary whaling craft and provisions only, and that the master of said brig is possessed of a certificate from the selectmen of the said island, setting forth that she is *bone fide* the property of the inhabitants of the island, with the names of the master and seamen in her; and that she shall not be found proceeding with her cargo to any other port than Nantucket or New York.

"Dated at New York, the first day of December, 1781.

"ROBERT DIGBY.

"To the commissioners of his majesty's ships and vessels of war, as well as of all privateers and letters of marque.

"By command of the Admiral:

"THOMAS M. PALMER."

* By a very disastrous fire at Nantucket, in 1846, the records both of the town and custom-house were destroyed, hence there arises much difficulty in getting many inter-

tion the people were in, exposed to the inroads of English and Americans, with neither side able or willing to protect them against the other, and powerless, because of the defenseless character of the island and the religious convictions of the vast majority of the inhabitants, to suitably guard their own firesides. They urged that people in continental towns, where the broad country opened to them a place for retreat, could have but faint ideas of the suffering of those who were constantly liable to hostile invasion and whose insular position precluded all thoughts of escape, and they indignantly resented the calumnies which had been spread broadcast through the State in regard to alleged actions of theirs. Regarding the prosecution of their business, they said:

"We now beg leave to throw a few hints before you respecting the Whalefishery, as a matter of great importance to this Commonwealth. This place before the War, was the First in that branch of business, & employed more than One Hundred Sail of good Vessels therein, which furnish'd a support not only for Five Thousand Inhabitants here, but for Thousands elsewhere, no place so well adapted for the good of the Community at large as Nantucket, it being destitute of every material necessary in the Business, and the Inhabitants might be called Factors for the Continent rather than Principals; as the war encreased the Fishery ceased, until necessity obliged us to make trial the last Year, with about about seventeen sail of Vessels, Two of which were captured & carried to New York,* & one was burnt the others made saving voyages. The present Year we employed about Twenty Four sail in the same business, which have mostly compleated their Voyages, but with little success; & a great loss will ensue; this we apprehend is greatly owing to the circumscribed situation of the Fishery; we are now fully sensible that it can no longer be pursued by us, unless we have free liberty both from Great Britain & America to fish without interruption; As we now find One of our Vessels is captured & carried to New York, but without any Oil on board, and Two others have lately been taken & carried into Boston & Salem, under pretense of having double papers on board, (Nevertheless we presume the captors will not say that any of our Whalemen have gone into New York during the season as such a charge would have no foundation in Truth). And if due attention is not paid to this valuable branch, which if it was viewed in all its parts, perhaps would appear the most advantageous, of any possess'd by this Government, it will be intirely lost, if the War continues: We view it with regret & mention it with concern, & from the gloomy prospect now before us, we apprehend many of the Inhabitants must quit the Island, not being able even to provide necessaries for the approaching Winter:

esting details. Many of the custom-records of New Bedford were destroyed by fire in 1825; the corresponding documents of Newport, prior to 1779, were carried away by the English, and the vessel containing them being sunk, they were, when recovered, in a very damaged condition; the similar records of Sag Harbor (the older ones) were stored in a damp place, and are mildewed and illegible.

*New York, at this time, was in possession of the English.

some will retreat to the Continent & set down in the Western Governments; and the most active in the Fishery will most probably go to distant Countries, where they can have every encouragement, by Nations who are eagerly wishing to embrace so favourable an opportunity to accomplish their desires; which will be a great loss to the Continent in general, but more to this Government in particular.

"We beg leave to impress the consideration of this important subject, not as the judgment of an insignificant few, but of a Town which a few Years since stood the Third in Rank (if we mistake not) in bearing the Burthens of Government; It was then populous and abounded with plenty, it is yet populous but is covered with poverty. Your Memorialists have made choice of Samuel Starbuck, Josiah Barker, William Rotch, Stephen Hussey and Timothy Folger, as their Committee who can speak more fully to the several matters contain'd in this Memorial, or any other thing that may concern this County, to whom we desire to refer you.

"Signed in behalf of the Town by—

"FREDERICK FOLGER,
"*Town Clerk.*"

This memorial was referred to a committee consisting of George Cabot, esq., on behalf of the Senate, and General Ward and Colonel McCobb on the part of the House, which committee on the 29th of October made the following report: "That altho' the Facts set forth in said Memorial are true and the Memorialists deserve Relief in the premises, yet as no adequate Relief can be given them but by the United States in Congress assembled, therefore it is the opinion of the Committee that the said Memorial be referr'd to the consideration of Congress, and the Delegates of this Commonwealth be required to use their Endeavours to impress Congress with just Ideas of the high worth & Importance of the Whale fishery to the United States in general, & this State in particular."* This report was accepted, and it was ordered

* Mass. Col. MSS., Petitions, i, pp. 124-5-6-7-8-9. A memorandum accompanies this, which various circumstances seem to indicate is the work of Mr. Rotch, and which says: "Perhaps some of those reports may have originated from this—a Committee of our Island in the fore part of the year 1781 applied to some of the Members of the General Court and spread before them the peculiar circumstances wherein the Island was involved, one whereof was that our Vessels whenever they passed in or out were perfectly under the controul of the Britons and it was therefore necessary that permits should be obtained from them for our Vessels to proceed on the Whale fishery—since which time some of them have been taken by the American Privateers for having such Permits—and we are thereby reduced to this difficulty that if we carry our Vessels over the bar without permits from the British Admiral they are made prize to the Britons—if they have such permits they are taken by our own Countrymen—and our harbour is therefore compleatly shut up—and all our prospects terminate in poverty and distress—what gives us great concern is that our people who understand the Whale fishery will be driven to foreign neutral Countries and many years must pass away before we shall again be enabled to pursue a branch of business which hath been in times past our support and hath yielded such large aids to the Commerce of this Country."

that the delegates be furnished with a copy of the memorial, and be required to take the action indicated in the report.

In addition to the action of the general court, the town also sent William Rotch and Samuel Starbuck to Philadelphia to intercede personally in the matter. After conferring with General Lincoln, Samuel Osgood, Nathaniel Gorham, Thomas Fitzsimmons, and James Madison, they approached one of the Massachusetts delegation who was a resident of Boston, and who was greatly prejudiced against Nantucket. After an interview of about two hours with no apparent relaxation of the bitterness of feeling on his part, Mr. Rotch questioned him as to whether the whale-fishery was "worth preserving to this country?" He replied, "Yes." "Can it be preserved in the present state of things by any place except Nantucket?" "No." "Can we preserve it unless you and the British will both give us permits?" "No." "Then, pray," continued Mr. Rotch, "where is the difficulty?" Thus this interview ended. Messrs. Rotch and Starbuck then drew up a memorial and presented it to the consideration of the above-named gentlemen, desiring them to review it, at the same time telling them of the conversation between Mr. Rotch and the delegate from Boston. By advice of these friends they waited again upon the member from Massachusetts, and he accepted the charge of bringing the subject before Congress, where, after deliberation, it was determined to grant permits for thirty-five vessels to sail on whaling voyages, and these were accordingly granted and delivered. The very next day a vessel arrived from Europe bringing the rumor of the signing of a provisional treaty of peace.*

This was early in 1783.† The passage from the provisional to the definitive treaty was long, circuitous, and at times dark. One of the chief sources of difference was the settlement of the question of the fisheries, England with an apparent feeling of magnanimity conceding favors, and America with a sense of justice claiming rights. Against what the United States considered her just dues the diplomacy of the English, their late enemies, and the French, their recent allies, was arrayed, and nothing but firmness, sagacity, and skill on the part of the American commissioners saved the day. The English guarded their assumptions with all possible jealousy; the French sought a loose place in the armor to insert the diplomatic sword, and gain by treaty what they had been unable to sustain with force. The Americans were ever on the alert to overcome the prejudices of a power from whom they had conquered a peace, and to propitiate the supersensitiveness of a power which had rendered them so valuable assistance. They could not, however, depart from certain propositions. The articles which must be inviolate were those guaranteeing to America full and unconditional inde-

* Memoranda of Wm. Rotch—unpublished.

† On the 22d of March, 1783, an order was passed in Congress granting 35 licenses to Nantucket vessels to whale and to secure them from the penalty attached to double papers. (Madison Papers, p. 405.)

pendence, and the withdrawal from the thirteen States of all British troops; the Mississippi as a western, and the Canadian line as it was prior to the Quebec act of 1774, for a northern boundary; and a freedom in the fishery off Newfoundland and elsewhere as it had been enjoyed prior to the commencement of hostilities. In vain Great Britain sought to evade the latter clause; the United States tenaciously, as in a vice, held her to it, and she yielded.

E.—FROM 1784 TO 1816.

But the announcement of peace came to a people whose commerce was sadly devastated. Save such of the interest as had been preserved by what Mr. Jefferson termed the Nantucketois, the business of whaling was practically ruined and required rebuilding. To Nantucket the war had, despite its holy necessity and its glorious conclusion, been a heavy burden. Of the little over 150 vessels owned there in 1775, 134 had fallen into the hands of the English and 15 more were lost by shipwreck; many of the young men had perished through the rigors of war;* in about 800 families on the island there were 202 widows and 342 orphan children; the direct money loss far exceeded $1,000,000 in times when a man's pay was 67 cents per day; one merchant alone lost over $60,000.† And as it was with Nantucket, so it was in a degree with all the whaling ports.‡ With an energy characteristically American, they sought, on the return of peace, to retrieve their losses. Scarcely had the echo of the hostile guns died away, scarcely had the joyful news of peace reached their ports, when the whalemen began to equip anew for their fishery. The Bedford, just returned to Nantucket from a voyage, was immediately loaded with oil and dispatched to London, arriving in the Downs on the 3d of February. Her appearance was thus chronicled by an English magazine of that day: "The ship Bedford, Captain Mooers,§ belonging to the Massachusetts, arrived in the Downs the 3d of February, passed Gravesend the 4th, & was reported at the Custom-House the 6th instant. She was not allowed regular entry until some consultation had taken place between the commissioners of the customs & the lords of council, on account of the many acts of parliament yet in force against the rebels in America. She is loaded with 487 butts of whale oil; is American built;‖ manned wholly

* It is estimated that no less than 1,200 seamen, mostly whalemen, were captured by the English or perished at their hands during the Revolution, from Nantucket alone!

† William Rotch, esq.

‡ Warren, R. I., suffered a loss of 12 vessels (about 1,100 tons), of which at least two were whalemen. (Hist. of Warren, p. 101.)

§ Capt. William Mooers, who sailed for many years in the employ of Messrs. Rotch & Co. It is related that one of the crew of the vessel first showing the American flag in the Thames was hump-backed. One day a British sailor meeting him clapped his hand upon the American's shoulder, saying, "Hilloa, Jack, what have you got here?" "Bunker Hill and be d——d to you," replied the Yankee, "will you mount?"

‖ The Bedford was built in 1765, by Ichabod Thomas, at North River. She was built a brig.

by American seamen; wears the rebel colors & belongs to the Island of Nantucket in Massachusetts. This is the first vessel which displayed the thirteen rebellious stripes of America in any British Port. The vessel lies at Horseley down a little below the Tower, and is intended immediately to return to New England." Immediately after, almost simultaneously with her, arrived another ship from Nantucket—the Industry, Capt. John Chadwick, while the sloop Speedwell, James Whippey, master, was sent to Aux Cayes.* Those at Nantucket who had capital left resumed the whale-fishery with as many vessels as they could procure. Long comparative immunity from capture had caused the whaling-grounds to become repopulated, and the whales themselves had become less shy and hence more easily killed. Directly succeeding the war the products of the fishery commanded good prices, and soon other ports entered into competition. New London, Sag Harbor, Hudson, N. Y., Boston, Hingham, Wellfleet, Braintree,† Plymouth, Bristol, each sent out one or more whale-hunters. For a brief time the business promised much profit, but the fever was a fitful one. The excessive prices which the commodity commanded immediately after the war‡ rapidly became reduced; Great Britain, the only market for the sperm-oil, had, by an alien duty of £18 sterling per ton, practically precluded its shipment from America. Oil which before the war was worth £30, now scarcely brought £17, while to cover expenses and leave a reasonable margin for profit, £25 were required.§ The situation was indeed desperate—almost hopeless. In the discussion of means for relief many of the people of Nantucket expressed the opinion that if the island could be made neutral, commercial affairs might assume a more healthy tone. A memorial was finally sent to the legislature of Massachusetts praying relief, and the agents presenting it were instructed to have the subject of neutrality acted upon. As may be readily supposed, however, the invidious legislation that Nantucket was unable to obtain during the war, she would scarcely be likely to get on its conclusion, and the subject of neutrality was very properly dismissed. That the depression in the whaling business needed some alleviation was, however, too evident to require discussion, and in 1785 the legislature passed the following preamble and resolution:

"Whereas this court, having a due sense of the high worth and importance of the whale fishery, are desirous of its preservation, not only to this State, but to the United States in general; therefore,

"*Resolved*, That there be paid, out of the treasury of this commonwealth, the following bounties upon whale-oil, of the different qualities hereafter mentioned, viz: For every ton of white spermaceti oil, five pounds; for every ton of brown or yellow spermaceti oil, sixty shillings; for every ton of whale oil, (so called,) forty shillings, that may be taken or caught

by any vessel or vessels, that are or may be owned and manned wholly by the inhabitants of this commonwealth, and landed within the same, from and after the first day of January next, until the further order of the general court."

The selectmen of the various towns were further empowered to appoint sworn inspectors to inspect all oil so landed, and mark on the head of each cask so inspected the initial letters of his name, and a description of the oil by the initials W. B., or Y. W. O., and deliver to the selectmen a sworn certificate thereof. To obtain the bounty, a certificate from the selectmen must be presented to the governor and council,* detailing the kind, quality, and amount of oil, and where landed To this certificate the owners were to make oath or affirmation.

But, although the bounty seemed at first beneficial, the ultimate effect was not so good. The business became unduly stimulated and an overproduction prevented to a great degree the desired advance in profit. The demand was greatly limited. A long suspension in the use of oil had accustomed the people in general to the use of tallow candles, and but little oil was required either for towns or for light-houses.

In the mean time, seeing no chance for any amelioration in their condition, unable to carry on a business at a prospective loss, and accustomed from early childhood only to this pursuit, hence unable and unwilling to adventure another, some of the prominent merchants of Nantucket resolved to transfer their business to some place where the demand for their products and the advantageous bounty offered would make it far more remunerative. Among these was William Rotch. On the 4th of July, 1785, Mr. Rotch sailed from Nantucket in the ship Maria, bound for London, arriving there on the 27th. At as early a day as practicable he opened negotiations with the Chancellor of the Exchequer (William Pitt) for a transfer to England of such of the whale-fishery at Nantucket as he could control.† The subject was laid before the privy council, and Mr. Rotch waited four months for their summons. Finally, in deference to a request of his

* Macy, 129.

† Captain Alexander Coffin was of those who looked upon the whale-fishery as a peculiarly American pursuit, and who denounced any effort looking to a transfer of it to any foreign government. On the 8th of June, 1785, he addressed from Nantucket a vigorous letter to the Hon. Samuel Adams. He wrote in severe terms against the measures being adopted to remove to England, and says Mr. Rotch "is now taking on board a double stock of materials, such as Cedar boards, (commonly called boat-boards,) of which they have none in England, a large quantity of cooper's stuff for casks, &c.—neither does it stop here, the house of Rotch have been endeavoring to engage an acquaintance of mine to go to Bermudas to superintend the business at that place." In a postscript he adds, "Since writing the above I have been favored with the original scheme of establishment of the Fishery at Bermudas, copies of which are here enclosed; one of the company is now at Kennebeck, contracting with some persons for an annual supply of *hoops*, staves, and other lumber necessary for the business." This letter was laid before the senate of Massachusetts, and the result was the passage of an act prohibiting the export to Bermudas of the articles enumerated, and the transfer in this direction was prevented.

that some one be appointed to close the matter, he was referred to Lord Hawksbury, a gentleman not very favorably disposed toward America. Mr. Rotch gave him his estimate of the sum necessary to induce a removal, viz, "£100 sterling transportation for a family of five persons, and £100 settlement; £20,000 for a hundred families." Lord Hawksbury demurred to this as a large sum.* At a subsequent interview Mr. Rotch added to his previous position the demand to bring with him thirty American ships, which demand also met with remonstrance from Lord Hawksbury, who seemed to be of the "penny wise pound foolish" order of statesmen. Mr. Rotch finally took leave of Lord Hawksbury without obtaining any satisfaction, and embarking on board his vessel sailed for France.† Landing at Dunkirk, he drew up proposals to the French government and forwarded them to Paris. These proposals were eagerly entertained, and the preliminaries were speedily arranged for a transfer of the interest of Mr. Rotch and his family and

* "And what," queried Lord Hawksbury, "do you propose to give us in return for this outlay of money?" "I will give you," returned Mr. Rotch proudly, "some of the best blood of the island of Nantucket." At this interview Hawksbury presented his own figures, where, says Mr. Rotch, (see MS.) "he had made his nice calculation of £87 10*s.* for transportation and settlement of a family," and, says he, "I am about a Fishery Bill, and I want to come to something that I may insert it, &c." My answer was, "Thy offer is no object, therefore go on with thy Fishery Bill without any regard to me." I was then taking leave and withdrawing. "Well, Mr. Rotch, You'll call on me again in two or three days." "I see no necessity for it." "But I desire you would." "If it is thy desire perhaps I may call." However, he let me rest but one day before he sent for me. He had the old story over again, but I told him it was unnecessary to enter again into the subject. I then informed him that I had heard a rumor that Nantucket had agreed to furnish France with a quantity of Oil. He stepped to his Bureau, took out one of a file of papers, and pretended to read an entire contradiction, though I was satisfied there was not a line there on the subject. I said, "It was only a vague report that I had heard, and I cannot vouch for the truth of it, but we are like drowning men, catching at every straw that passes by; therefore I am now determined to go to France and see what it is. If there is any such contract, sufficient to retain us at Nantucket, neither you nor any other nation shall have us, and if it is insufficient, I will endeavor to enlarge it." "Ah," says he, "Quakers go to France?" "Yes," I replied, "but with regret." I then parted with Lord Hawksbury for the last time. (Rotch MS.)

† His lordship sent once more for Mr. Rotch to call on him, but Mr. Rotch returned answer: "If Lord Hawksbury desires to see me he will find me on board my vessel up to the hour when she takes her anchor." When Mr. Rotch was once gone, Hawksbury became alarmed and sent to him by letter, informing him that he had made provision in the fishery bill for him, with liberty to bring forty ships instead of thirty, "he having forgotten the number;" but it was too late. This unexpected ending of his hopes was far from pleasing either to his lordship or the government. After the interview with the King of France, Mr. Rotch returned to England, and was importuned to remove to Great Britain. In his memoranda he says he was waited upon by one of the officials, who told him he was "authorized by Mr. Pitt to tell you that you shall make your own terms." "I told him," continues Mr. Rotch, "he was too late. I made very moderate proposals to you, but could obtain nothing worth my notice. I went to France, sent forward my proposals, which were doubly advantageous to what I had offered your Government; they considered them but a short time, and on my arrival in Paris were ready to act. I had a separate interview with all the Ministers of State necessary to the subject, five in number, who all agreed to & granted

friends to Dunkirk, from which port, for several years, a very successful fishery was carried on. Contemporary with the negotiations with Mr. Rotch, a letter was dispatched to the people of Nantucket by Capt. Shubael Gardner, from L——— Coffin, who resided at Dunkirk, stating that his sympathy for the people of that island had led him to apply to the French government in their behalf, and with excellent success. Every request he had made had been granted, and the unlimited freedom, the abundance and cheapness of provisions, the absence of custom-houses, the small taxes, the regularity of the town, the manners and industry of the inhabitants, and its situation, rendered it, in his opinion, "the most eligible place in the universe for the people of Nantucket to remove to.*

What effect this state of affairs may have had in the arrangement of treaties of commerce with Great Britain is somewhat uncertain, but the attempt to a consummation of this plan was intrusted to a man not only

my demands. This was effected in five hours, when I had waited to be called by your Privy Council more than four months." All attempts on the part of the English government to re-open the subject were politely but firmly rejected by Mr. Rotch. "In the beginning of 1793," the account continues, "I became fully aware that war between England & France would soon take place, therefore it was time for me to leave the Country in order to save our vessels if captured by the English. I proceeded to England. Two of them were captured, full of oil, & condemned, but we recovered both by my being in England, where I arrived two weeks before the war took place. My going to France to pursue the whale-fishery so disappointed Lord Hawksbury that he undertook to be revenged on *me* for his own folly, and I have no doubt gave directions to the Cruisers to take any of our vessels that they met with going to France. When the Ospray was taken by a King's ship, the officer sent on board to examine her papers, called to the captain & said, "You'll take this vessel in sir, she belongs to Wm. Rotch." Mr. Rotch returned to the United States with several of his vessels in 1794, and after residing in Nantucket about a year removed to New Bedford, where he lived until his death, in May, 1828.

* The following is a list of advantages secured to Nantucket whalemen by Mr. Coffin:

"1st. An entire free exercise of their religion or worship within themselves.

"2d. The concession of a tract of ground to build their houses and stores.

"3d. All the privileges, exemptions, and advantages promised by the king's declaration in 1662, confirmed by letters-patent of 1784, to all strangers who come to establish there, which are the same as those enjoyed by the natif subjects of his majisty.

"4th. The importation into the kingdom, free from all duties whatever, of the oil proceeding from their fishery, and the same premiums and encouragement granted for the cod and other fisheries to natif subjects.

"5th. A premium per ton on the burthen of the vessels that will carry on the whale fishery, which shall be determined in the course of the negotiation either with Mr. Rotch or with the select men of the island.

"6th. All objects of provisions and victuals for their ships shall be exempted from all duties whatever.

"7th. An additional and heavier duty shall be laid on all foreign oil, as a further encouragement to them, in order to facilitate the sale of their own.

"8th. The expenses of removing those of the inhabitants, who are not capable of defraying themselves, shall be paid by the Government.

"9th. A convenient dock shall be built to repair their ships.

"10th. All trades-people, such as smiths, boat-builders, coopers, and others, shall be admitted to the free exercise of their trade without being liable to the forms and ex-

thoroughly imbued with New England principles, but of sufficient statesmanship to realize of how much national importance this matter was. None knew better than John Adams that the secret of the commercial greatness which should be developed lay in the codevelopment of the fisheries; that herein was the nursery for seamen who would be a source of wealth in peace and of power in war. It was desirable to make duties and courtesies more reciprocal, and one of the first duties intrusted to Mr. Adams on his appointment to the Court of St. James in 1785, was the arrangement of some treaty which should be mutually satisfactory. Naturally one of the principal points was the importation of the products of our fishermen, since that industry perhaps more than any other was in danger of serious injury from the existing condition of things.

In a letter to the Marquis of Carmarthen, dated July 29, 1785, Mr. Adams refers to the trouble accruing from the alien duties laid by England in these words: "The course of commerce, since the peace, between Great Britain and the United States of America, has been such as to have produced many inconveniences to the persons concerned in it on both sides, which become every day more and more sensible. The zeal of Americans to make remittances to British merchants, has been such as to raise the interest of money to double its usual standard, to increase the price of bills of exchange to 8 or 10 per centum above par, and to advance the price of the produce of the country to almost double the

---

pense usually practised and paid by the natif subjects for their admittance to mastership.

"11th. They shall have liberty to command their own vessels, and have the choice of their own people to navigate them.

"12th. They shall be free from all military and naval service, as well in war as in peace, in the same manner and extent as expressed by the king's ordinance of the 16th of February, 1759." (Macy, 257, 258.)

These were probably essentially the same concessions made to Mr. Rotch in person. How many American captains pursued the fishery from the various British and French ports subsequently to the Revolution, it would be difficult to determine. Nantucket alone furnished 83 captains for the French and 149 captains for the English fishery; probably the bulk of the total number came from this one port, though in the course of the prosecution of whaling by these nations, New Bedford furnished a very considerable number. In a "Journal of a Voyage to Greenland" from Dunkirk in the ship Penelope, Capt. Tristram Gardner (a Nantucket man,) he records under the head of Friday, June 6, 1788, in latitude 70° north, "100 *ships in sight*." On the 22d of the same month he states, as a mere matter of fact not worthy of extended comment, "Wind at South; A Ruged sea; Plenty of Snow. Later Part Saw Ise to ye S. W. of us a 4 ye wind Shifted to ye Northward, but Still thick weather. Saw A Number of ships, but No whale. So ends this 24 hours. Lat. 79. 02." And yet this is within about 175 miles of the highest northern point attained by any of our splendidly equipped expeditions undertaken with the express purpose of pushing as far north as possible in vessels armored and strengthened and equipped in the most complete manner, while the whaling voyages were pursued in small, not uncommonly strong ships, not even having the feeble protection of coppered bottoms. As early as 1753, a schooner was fitted from Boston for the discovery of the northwest passage. She sailed in the spring and returned in October of the same year.

usual rate. Large sums of the circulating cash, and as much produce as could be purchased at almost any rate, have been remitted to England; but much of this produce lies in store here, because it will not fetch, by reason of the duties and restrictions on it, the price given for it in America. No political arrangements having been made, both the British and American merchants expected that the trade would have returned to its old channels, and nearly under the same regulations, found by long experience to be beneficial; but they have been disappointed. The former have made advances, and the latter contracted debts, both depending upon remittances in the usual articles, and upon the ancient terms, but both have found themselves mistaken, and it is much to be feared that the consequences will be numerous failures. Cash and bills have been chiefly remitted; neither rice, tobacco, pitch, tar, turpentine, ships, oil, nor many other articles, the great sources of remittances formerly, can now be sent as heretofore, because of restrictions and imports, which are new in this commerce, and destructive of it; and the trade with the British West India Islands, formerly a vast source of remittance, is at present obstructed. * * * * * * There is a literal impossibility, my lord, that the commerce between the two countries can continue long to the advantage of either upon the present footing."* He continues, that these evils will increase, and asserts that it is the desire of the United States to be on good terms commercially with England, and not be driven to other markets with their goods, and he closes by proposing the arrangement of a treaty of commerce between the two countries.

It would be interesting, though not necessary in this connection, to follow the negotiations through each step; to see how the English administration felt compelled to cater to those who upheld the British navigation laws; to see how jealousy of our incipient naval power procrastinated the treaty which it was inevitable must come; to see how self-confident and secure the English felt that our trade must unavoidably come to them; to see, how, an attempt was made to throw the influence of Ireland against America by ostentatious concessions, and how the attempt failed; to see how, finally, the fear of American reciprocity in restrictions led to English reciprocity in concessions; but those things can be more satisfactorily learned from the diplomatic correspondence of the day.†

On the 24th of August Mr. Adams had a conference with Mr. Pitt for the first time in this connection. Passing by the matter of the interview, so far as it relates to the other portions of the proposed treaty, we find that when the treaty of commerce was proposed, Mr. Pitt inquired what were the lowest terms that might be satisfactory to America. Mr. Adams replied that he might not think himself competent to decide that question; that, because of the rapidly increasing feeling in America,

* Works of John Adams, viii, p. 288.

† Works of John Adams, viii, p. 307.

affairs had already culminated in Massachusetts in the passage of an act of navigation by that State, showing the tendency of the times, and that the action of England would have much to do in arresting that prejudice; that the five hundred ships employed in the commerce of the United States in 1784 might easily be compelled to become the property of American citizens and navigated wholly by American seamen; that the simple passage of an old English statute, "that none of the King's liege people should ship any merchandise out of, or into the realm, but only in ships of the King's liegance, on pain of forfeiture," modified to suit the American form of government, would effect this; that the nation had the legal right to govern its own commerce; that the ability of the Americans to build ships and the abundance of material they had for that purpose could not be doubted; and that whatever laws England might make, she would be glad to receive and consume considerable American produce, even though imported through France or Holland, and sell us as many of her manufactures as we could pay for, through the same channels. The conversation finally introduced the subject of ships and oil, and Mr. Pitt said to Mr. Adams the Americans "could not think hard of the English for encouraging their own shipwrights, their manufactures of ships, and their own whale-fishery." To which Mr. Adams replied, "By no means, but it appeared unaccountable to the people of America, that this country should sacrifice the general interests of the nation to the private interests of a few individuals interested in the manufacture of ships and in the whale-fishery, so far as to refuse these remittances from America in payment of debts, and for manufactures which would employ so many more people, augment the revenue so considerably, as well as the national wealth, which would, even in other ways, so much augment the shipping and seamen of the nation. It was looked upon in America as reconciling themselves to a diminution of their own shipping and seamen, in a great degree, for the sake of diminishing ours in a small one, besides keeping many of their manufacturers out of employ, who would otherwise have enough to do; and besides greatly diminishing the revenue, and, consequently, contrary to the maxim which he had just acknowledged, that one nation should not hurt itself for the sake of hurting another, nor take measures to deprive another of any advantage without benefitting itself."* From the questions of comparative gains or losses to either power, and the relations in which France would stand to both, Mr. Pitt led Mr. Adams into a lengthy and useless conversation on the whale-fisheries of the three countries, referring specially to the efforts of M. de Calonne to introduce this pursuit into France, asking suddenly the question "whether we had taken any measures to find a market for our oil anywhere but in France." To this Mr. Adams replied: "I believed we had, and I have been told that some of our oil had found a good market at Bremen; but there could

*5th Richard, ii, ch. 3.

not be a doubt that spermaceti oil might find a market in most of the great cities in Europe which were illuminated in the night, as it is so much better and cheaper than the vegetable oil that is commonly used. The fat of the spermaceti-whale gives the clearest and most beautiful flame of any substance that is known in nature, and we are all surprised that you prefer darkness, and consequent robberies, burglaries, and murders in your streets, to the rec iving, as a remittance, our spermaceti oil. The lamps around Grosvenor Square, I know, and in Downing Street, too, I suppose, are dim by midnight, and extinguished by two o'clock; whereas our oil would burn bright till 9 o'clock in the morning, and chase away, before the watchmen, all the villains, and save you the trouble and danger of introducing a new police into the city."*

But despite the fact that Mr. Pitt appeared more favorable than was anticipated, Mr. Adams did not expect any immediate response to his propositions. The English ministers in their individual capacity seemed singularly timorous, and manifested much fear of committing themselves before joint cabinet action. Adams inclined to the opinion that nothing short of the convincing eloquence of dire necessity would drive the English ministry from the position they had assumed in regard to the navigation act, and that an answer to his propositions, even at a late day, was doubtful, without Congress authorized similar acts with the United States, and these counter-irritants were actually put in force, to determine on which side the inconvenience was greatest. The great cry in the United Kingdom was: "Shall the United States be our ship-carpenters? Shall we depend upon a foreign nation for our navagation? In case of a war with them, shall we be without ships, or obliged to our enemies for them?" How much this nightmare of inability to cope with their late colonies in anything like a fair field was stimulated by the government is uncertain, but the authorities evidently used no efforts to allay it.†

The effort to bring about the desired compromise continued, as Mr. Adams had judged it would, all the succeeding fall and winter. In January, 1786, Bowdoin wrote to Adams, in reply to a letter from him, that the navigation act of Massachusetts had been so modified as to be only operative against Great Britain, and copies of the repealing act had been sent to the executives of the other States in order to secure

* Works of John Adams, viii, pp. 308–309.

† In negotiation with the Portuguese ministers in November, 1785, Mr. Adams asked (viii, p. 340) if they did not want our sperm-oil. He replied that they had olives and made oil from them; they had no use for their own sperm-oil and sold it to Spain. "They had now," he said, "a very pretty spermaceti-whale fishery, which they had learned of the New Englanders, and carried on upon the coast of Brazil." According to the Boston News-Letter of April 21, 1774, the method of obtaining their knowledge was somewhat open to objections. (See p. 57.) In 1805, the Portuguese attempted to carry on the whaling business from Mozambique, and Timothy Folger, Francis Paddack, William Hull, and John Hillman, of Nantucket, went there to take charge of the fishery; but early in 1810 accounts were received at Nantucket stating that they had all been taken sick and died there.

harmony of action upon this point. In regard to the effect the existing English laws would have upon the interest which is under consideration here, he wrote: "It is very true, their encouragement of their whale-fishery, by suffering the alien duty on oil to depress ours, will increase their shipping in this branch, increase their seamen, and, in several other ways, be advantageous to them. To a person that looks no farther, it would appear that this was good policy; and the goodness of it would be inferred from the advantages arising. But when he should extend his view, and see how that stoppage of the American whale-fishery, by depriving the Americans of so much capital a means of paying for the woolen goods they used to take of Britain, must, at the same time, occasion the American demand to cease, or be proportionately diminished, not to mention the risk of a change or deviation of the trade from the old channel, he will calculate the national profit and loss that arises from that stoppage.

"Three thousand tons of oil was the usual annual quantity produced by the whalemen at Nantucket; all of which was shipped to England, at an average price of £35 per ton, making about £105,500. The whole of which went to pay for and purchase a like amount of woolens and other British goods; nine-tenths of the value of which are computed to arise from the labor of the manufacturer, and to be so much clear gain to the nation. The other tenth, therefore, being deducted, gives the national gain arising from the industry of the Nantucket whalemen, and the capital employed in that business, namely £94,500, without the nation's paying a shilling for the risk of insurance, or any other risk whatever.

"On the change of trade, pursuant to the new regulations, the British merchants must employ a large capital in the whale-fishery, whose products we will suppose equal to that of the Nantucket, £105,000. They will have made an exceeding good voyage, if the whole of that sum should be equal to one-half of the cost of the outfits; though, from many of the vessels not meeting with fish, and from a variety of accidents to which such a voyage is subject, it probably would not be a quarter. The whole of the product goes towards payment of the outfits and charges of the voyage, and a large sum must be advanced for the second voyage, &c.

"Now, although this mode of commerce would be productive of some national benefits, yet, considered in a comparative view with the benefits arising from the former mode, they would be found of little importance. A like comparison may be made with other branches of commerce, particularly the British West Indian, and the result will be found the same. For the sake, then, of gaining pence and farthings, Britain is sacrificing pounds by her new regulations of trade. She has a right to see for herself; but, unhappily, resentment and the consequent prejudices have so disordered her powers of vision, that it requires the skilful hand of a good political optician to remove the obstructing films

If she will not permit the application of your couching instruments, or, if applied, they can work no effect, the old lady must be left to her fate, and abandoned as incurable."*

On the 21st of January, 1786, Mr. Adams, in a letter to Secretary Jay, writes: "It will take eighteen months more to settle all matters, *exclusive of the treaty of commerce.*"† And thus it continued. Argument and persuasion had no effect. Convinced in spite of themselves, they still clung fondly, obstinately, perhaps foolishly, to their obnoxious laws. As late as November, 1787, Mr. Adams writes to Mr. Jay: "They are at present, both at court and in the nation at large, much more respectful to me, and much more tender of the United States, than they ever have been before; but, depend upon it, this will not last; they will aim at recovering back the western lands, at taking away our fisheries, and at the total ruin of our navigation, at least."‡ Mr. Adams's position at the court of St. James was terminated, by his urgent request, soon after this, and the question of commercial relations between the two countries was still unsettled.§

This state of affairs was scarcely such as would occasion the utmost harmony. The United States naturally resented this frigid manner of treating our overtures for friendship. In August, 1786, Mr. Jefferson, in a letter from Paris to Mr. Carmichael, writes: "But as to every other nation of Europe, || I am persuaded Congress will never offer a treaty. If any of them should desire one hereafter, I suppose they will make the first overtures." ¶

But while America was exerting herself so unsuccessfully to be allowed to live on terms of civility with England, the whale-fishery carried on from within her borders was languishing.

Like the effect of the heat of the sun on the iceberg, so was the effect of foreign bounties upon the American fishery, dissolving it, breaking off a fragment here and a fragment there. Lured by the promise of English bounties, discouraged with the prospect in America, where the price for oil would scarcely repay the cost of procuring it and where there was no

* Adams, viii, 363-4, In his reply to Mr. Bowdoin, under date of May 9, 1786, Mr. Adams, after expressing surprise that such reasoning as his (Bowdoin's) has no effect on the English cabinet, writes: "Mr. Jenkinson, an old friend of the British empire, is still at his labors. He is about establishing a bounty upon fifteen ships to the southward, and upon two to double Cape Horn, for spermaceti whales. Americans are to take an oath that they mean to settle in England, before they are entitled to the bounty." In September, 1786, Mr. Adams writes to Mr. Jefferson from London, (viii, 414): "The whalemen, both at Greenland and the southward, have been unsuccessful, and the price of spermaceti-oil has risen above £50 per ton."

† Adams, viii, 363-4, 389.

¶ Jefferson, ii, 18.

market for their chief staple, several of the people of Nantucket removed to the vicinity of Halifax, in Nova Scotia. There, in 1786 and 1787, they settled, building dwellings, wharves, stores, manufactories for sperm-candles and such other structures as were connected with their fishery, and calling their new settlement Dartmouth.* There they carried on the pursuit for several years prosperously, and gave promise of considerable commercial importance. But the disintegration which commenced at Nantucket continued at Dartmouth, and just as the settlement seemed about to become thrifty and important it began to become divided, pieces again split off, and the village, as a whaling-port, soon became a thing of the past. Those who were the earliest to remove from Nantucket soon grew uneasy of their new location, and having greater inducements offered them if they removed to England, again migrated, and settled in Milford Haven, from whence for many years they carried on the business with very considerable success. The parent died in giving birth to the child; Milford Haven flourished, but at the expense of Dartmouth's existence.

France did not view this transfer with indifference. The scheme for the building up of the fishery at Dunkirk by emigration from Nantucket having proven only partially successful,† it was desirable to inaugurate some other measures to prevent further increase of the business in England. A committee of gentlemen well informed in such matters was instructed to investigate and report on the subject of encouragement of a general commerce with the United States. It was evident that the American whalemen could not be induced to leave their native country if they could support themselves there. The natural inference was, if a market could be opened to their products which would replace the one closed, they would not emigrate. Accordingly upon this point the committee reported in favor of an immediate abatement of the duty upon oil and a promise of a further abatement after the year 1790. The letter of M. de Calonnes

* Works of Jefferson, ii, 518. Mr. Jefferson says, referring to a further hegira of the islanders: "A vessel was already arrived from Halifax to Nantucket, to take off some of those who proposed to remove; two families had gone on board, and others were going, when a letter was received there which had been written by Monsieur le Marquis de Lafayette to a gentleman in Boston, and transmitted by him to Nantucket. The purport of the letter was, to dissuade their accepting the British proposals, and to assure them that their friends in France would endeavor to do something for them. This instantly suspended their design; not another went on board, and the vessel returned to Halifax with only the families." In 1796 Wm. Rotch & Son petitioned Congress to remit the excess of duties and tonnage charged then on two whale-ships by the collector of New Bedford, in consequence of their not being provided with United States registers. These were ships which sailed from Nantucket in 1787 and 1789, under registers from the State of Massachusetts, and were used in the Dunkirk fishery, returning to the United States in 1794, some years after the National Government had been in operation. The committee which was appointed to consider the petition reported favorably upon it, and the prayer was granted. (State Papers, vii, p. 411.)

† "Nine families only, of thirty-three persons in the whole, came to Dunkirk."—(Jefferson, ii, 519.)

(who was in treaty with the Nantucket whalemen), recommending this, was immediately sent to America, and after careful investigation of the subject, the *arret* of the 29th of December, 1787, ratifying the abatement and promising a further one if the French King found such a proceeding of mutual benefit, was passed.

But the measure in this form had a contrary effect from what was intended. "The English," says Jefferson,* "had now begun to deluge the markets of France with their whale oils; and they were enabled by the great premiums given by their government, to undersell the French fisherman, aided by feebler premiums, and the American, aided by his poverty alone. Nor is it certain, that these speculations were not made at the risk of the British government, to suppress the French and American fishermen in their only market. Some remedy seemed necessary. Perhaps it would not have been a bad one, to subject, by a general law, the merchandise of every nation, and of every nature, to pay additional duties in the ports of France, exactly equal to the premiums and drawbacks given on the same merchandise, by their own government. This might not only counteract the effect of premiums in the instance of whale oils, but attack the whole British system of bounties and drawbacks, by the aid of which, they make London the centre of commerce for the whole earth. A less general remedy, but an effectual one, was, to prohibit the oils of all *European* nations; the treaty with England requiring only, that she should be treated as well as the most favored *European* nation. But the remedy adopted was to prohibit all oils, without exception."† And this on the 20th of September, 1788, only nine months from the passage of the former law.‡

Through the exertions of Jefferson this error, political as well as commercial, was remedied, and in December, 1788, the abatement of duties on oils was so arranged as to make the American and the French on the same footing, and cut off all danger of overstocking from European

* Jefferson ii, 520.

† Jefferson, ii, 521. "The annual consumption of France, as stated by a person who has good opportunities of knowing it, is as follows:

	Tons.
"Paris, according to the registers of 1786	1,750
"Twenty-seven other cities, lighted by M. Sangrain	500
"Rouen	312½
"Bordeaux	375
"Lyons	187½
"Other cities, for leather and light	1,875
	5,000"

‡ Jefferson states (ii, 523) that before the war Great Britain had less than 100 vessels engaged in whaling, while America employed 309. (This does not take into account Sag Harbor, New York, nor the very important fishery from Newport, Providence, and Warren, in Rhode Island, which Mr. Jefferson seems to have overlooked in his report.) In 1788 these circumstances were reversed, America employing 80, and Great Britain 314.

rivals, and in January, 1789, this arrangement received its legal ratification.*

The revival of the business in the United States, and the growing scarcity of whales in the waters heretofore mostly frequented, made the equipping of larger vessels a necessity, and from the sloops and schooners which formerly composed the greater portion of the whaling fleet an advance was made to brigs and ships, and the field still farther extended.† The sperm-whale being of the most value, the effort to encompass his capture was greater; and he was pursued, as he fled from his old haunts, till the Pacific Ocean was attained.‡ At Nantucket the number of vessels soon increased to such an extent that it became necessary to go abroad for men to man them, and some Indians and a large number of negroes were brought from the mainland to aid in filling the crew-lists. Ups and downs the business had then, as it ever has since. A presumed prosperity induced competition, the markets became glutted, and oil was sold at less than the cost of production. The price of whalebone became reduced to 10 cents per pound and less, instead of commanding a dollar as it did prior to the Revolution. The disturbances between England and France, and the internal commotions to which the latter country was subjected, effectually annulled the effect of the French *arret* of 1789. So disastrously did these things affect whaling that the quarrels of France and England forced many Nantucket men to sell their vessels, others to dismantle and lay theirs up, while a few still held on, some making a little profit, the majority suffering a severe loss.

* Jefferson, ii, 539. When the Arret of 29th December, 1787, was drawn up, the first draught was so made as to exclude *all European oils*, but at the very moment of passing it, they struck out the word "European," so that our oils became involved. "This, I believe," says he, "was the effect of a single person in the ministry."

† Sag Harbor re-entered the business in 1785; New Bedford in 1787 or 1788. (See Returns of the Fleets.)

‡ In the Pacific the Americans had been preceded by the Amelia, Captain Shields, an English fitted ship, manned by the Nantucket colony of whalemen; and sailing for that ocean from London in 1787, her first mate, Archelus Hammond, killing the first sperm whale known to have been taken in that ocean.

In Jefferson's Report he enumerates three qualities of oil: 1, the sperm; 2, that from the ordinary right whales; 3, that from the right whales on the Brazil Banks, which was darker in color and of a more offensive odor when burned than from No. 2.

In 1791 six ships sailed for the Pacific fishery from Nantucket and one from New Bedford. In the mean time ships from Dunkirk, among them the Falkland, Canton, and the Harmony, had already performed their voyages, and in February, 1792, arrived at Dunkirk with full cargoes. It was the custom in those days to nearly fill with sperm, then return to the Atlantic Ocean and complete their load on the coast of Patagonia or on Brazil Banks, commanders preferring to round Cape Horn with a snugly loaded ship. The brig Sea Horse, Captain Mayo, which arrived at Cape Ann, October 4, 1789, from a whaling voyage to Woolwich Bay, reported a very singular sinking of a point of land there, in sight of quite a large fleet both English and American, the water having a depth of six fathoms where just before was apparently solid land.

In 1798* came the threats of disturbance between France and the United States. French privateers in the excess of their zeal preyed upon American commerce as well as upon that of the powers with whom they were in direct conflict. A large number of vessels fell victims to these depredators, and the friendly relations existing somewhat precariously between France and the United States became nearly supplanted by a state of actual warfare. The whaling interest, as usual, was among the earliest sufferers. Early in 1799 many parties in Nantucket sold their ships rather than fit them out at the risk of capture. News began to reach the island that vessels were already captured, and the business of the islanders both in fishing and trading almost ceased. Instead of fitting out a dozen ships for whaling but two or three were fitted, and sadness and gloom shrouded every face. The difficulties were finally adjusted and business resumed its old channels, but the losses which the unfortunate Nantucketers sustained by the unjustifiable, piratical depredations, though settled to the satisfaction of our Government and duly receipted for, with others, by the United States, have never been remunerated, while some of the unlucky owners, officers, and underwriters, in comfortable circumstances at the commencement of these troubles, lost their little property, the accumulations of years, and died in poverty.† These unauthorized captures were not

* The Boston papers of 1796 reported that the Carisford frigate had arrived at the Cape of Good Hope from England with credentials constituting General Graig governor of the colony, the limits of which were to be so arranged as to cut off other nations from participation in the Delago Bay fishery.

† The subject of the French spoliations is one to which the people of Nantucket have been particularly sensitive. Isolated communities are more liable to feel that the injustice done to one is an injustice to all; hence, although comparatively few of the islanders suffered from the depredations of the French, or rather from the apparent breach of faith on the part of a government bound to protect them and their interests, all felt that seeming injustice as a personal matter. In a letter to the Hon. George McDuffie, giving an account of the claims of Nantucket in this behalf, published in the Warder of May 20, 1846, the following is described as the actual condition of the claimants and character of the demands:

"Ship Joanna, Coffin, taken with 2,000 barrels of oil on board; value of ship and cargo $40,000; one of the original owners still living—seventy-five years old and *poor;* one of the crew also living, *poor;* the master and mate died recently, *poor;* children still surviving; *claim never sold.* Ship Minerva, Fitch, 1,500 barrels of oil on board; value $30,000; one of the original owners living, sixty-eight years old, *poor;* master still alive, seventy-eight years old, with small means and many dependants; one of the crew alive, *poor; claims never sold.* Ship Active, Gardner, 3,000 barrels of oil on board; value $50,000; same owners as Minerva with captain; Captain Gardner died two years ago at the age of eighty-five, leaving a large family and grandchildren; *claims never sold.* Ship Ann, Coffin, (in merchant service); loss of ship $10,000; the captain left a large family in slender circumstances; one of the underwriters died a few years since, in the almshouse, who, at the time of the capture, stood high among Nantucket merchants; *claims never sold.*"

Speaking in the interest of the whale-fishery, it may be safely asserted that the people of Nantucket view with regret and disappointment what they consider the gross injustice showed to them (with others) in putting off, upon untenable pretexts, the settlement of these demands. The stern logic of poverty and the almshouse is keener

confined exclusively to the French, for in 1800 the Spanish authorities at Valparaiso, emulating the hostility to a power ostensibly at peace with them, which the French had shown, seized and condemned the whale-ships Miantonomah, of Norwich, and Tryal, of Nantucket.*

From this time till the opening of the second war with England, whaling was pursued with a gradually-augmenting fleet. And this in the face of the uncertainties which the increasingly critical state of affairs between the United States and England occasioned. In 1802 Nantucket added five ships to her fleet, and New London sent her first large vessel,† and in 1806 the quantity of oil imported into the country was considerably in excess of the consumption.

The embargo act, of 1807, almost suspended the pursuit, not so much by actual proscription as because of the impossibility of effecting insurance upon the vessels, but it soon received another impetus on account of the prospect of a general peace throughout Europe.

The commencement of the war of 1812 found a large portion of the whaling-fleet at sea. Trusting that the causes of contention between England and America would be removed without the necessity of a final appeal to arms, many owners had fitted out their ships. This was particularly the case at Nantucket, from which port a large proportion of the fleet had sailed for the Pacific Ocean on voyages varying from about two years to two years and a half.‡ With the reception of the news of the declaration of war a large portion of the vessels in the North and South Atlantic, and some of those in the Pacific, turned their prows homeward, hoping to make the home port before the seas swarmed with letters-of-marque and national vessels of war. Many of these vessels from Nantucket on arriving home sailed thence immediately for Boston, Newport, New Bedford, or some other fortified port, where they could ride out the storm of war in security. After the month of July, 1812, was ushered in, reports of the capture of whaling-vessels came thick and fast to Nantucket. § First came the news of the taking and burning of the schooner Mount Hope, David Cottle master. In quick succession they learned of the capture of the Alligator, Hope, Manilla,

than the sophistries of politicians. The Fox, of New Bedford, Captain Coffin Whippey, captured in 1796 with 1,500 whale and 500 sperm, was another case. In 1853 Captain Whippey—captured a second time in 1798—was living, but dependent upon charity.

* The Miantonomah was a new ship, on her first voyage.

† In 1794 the ship Commerce, of East Haddam, was fitted for a whaling voyage, and sailed from New London on February 6 of that year. In 1770 Capt. Isaiah Eldridge, of the sloop Tryall, of Dartmouth, spoke, among other whalemen on the Davis' Strait ground, Thomas Wiccum, (Wiggin?) of New London.

‡ See Macy, 161–2–3.

§ When war seemed inevitable the ship-owners of Nantucket held a meeting to take into consideration the subject of how to best secure the fleet from capture. It was proposed to request the British minister at Washington to use his influence with his government to obtain from them immunity from capture of whale-ships belonging to the island. This plan was ultimately abandoned, the majority of the owners being of the opinion that "the prospect of success was too faint to warrant the attempt." (Macy, 165.)

Ocean (brig), Ranger, Fame,* Rose, Renown,* Sterling, Edward, Gardner, Monticello, Chili, Rebecca, and others, and it may be easily imagined that the prospect for the islanders had but little in it that appeared encouraging. New Bedford, too, although at this time her interest in this business was far less than that of Nantucket, suffered from the capture of her whaling-vessels.†

Again did war put an effectual stop to the pursuit of whaling from every port of the United States save Nantucket, and again were the inhabitants of that town, knowing no business except through their shipping, compelled to strive to carry their commercial marine through the tempest of fire as free from complete destruction as possible. A new source of danger presented itself. Prior to the declaration of war between Great Britain and America our whalemen on the coast of Peru‡ had often suffered from piratical acts of the Peruvian privateers, being continually plundered and cut out from Chilian ports whither they had gone to recruit. The chronic state of affairs on this coast being one of war, the Government of the United States had sent the Hon. Joel R. Poinsett, of South Carolina, to those parts to see that American commerce was suitably protected, but for several months his remonstrances had been worse than useless. The declaration of war between England and the United States gave the Peruvian corsairs a fresh pretext for the exercise of their plundering propensities. They claimed that they were the allies of England, and as such were entitled to capture the vessels of any power with which she was at war. An expedition was equipped by the authorities of Lima and sent on its marauding way. This army succeeded in capturing the towns of Conception and Talcahuano. In the latter port was a large number of American ships, many of them whalemen, who, having obtained their cargoes of oil, had put in to recruit with provisions and water before making the homeward voyage. Among these were the ships Criterion, Mary Ann, Monticello, Chili, John and James, Lima, Lion, Sukey, Gardner, President, Perseverance, and Atlas, of Nantucket.

This was in April, 1813. These vessels were detained in the harbor by the Limian armament, which consisted of two men-of-war, with about

* The Fame was used in the English fishery, and the Renown under the name of "Adam," while engaged in the same pursuit under the same flag, went ashore on Deal beach and bilged in 1824 or 1825.

In 1812 the brig Nanina, Capt. Valentine Barnard, of New York, sailed to the Falkland Islands on a sealing and elephant-oil cruise. The British ship Isabella having become wrecked, her crew were rescued by the Nanina, and showed their gratitude to Captain Barnard by seizing his vessel and setting him, with Barzillai Pease, Andrew Hunter, and E. Pease, of his crew, ashore on New Island, one of the group. A protest signed by the four was published in the Hudson Bee, and also in the supplement of Niles' Register for 1814.

† The ship Sally, Clark master, was captured while homeward bound with 1,200 barrels of sperm-oil on board. Value of vessel and cargo $40,000. The Triton also was captured, involving a loss of $16,000.

‡ These vessels belonged almost exclusively to New Bedford and Nantucket.

1,500 troops. Having found a bag containing about $800 on board the President, they carried her captain, Solomon Folger, ashore under a guard and imprisoned the remaining officers and crew, excepting the mate, one boat-steerer, and the cook.

Learning of this condition of affairs, Poinsett immediately joined the Chilian army and directed its movements. On the 15th of May a battle was fought between the contending forces near the town of San Carlos, but when the day had closed neither side could claim the victory. Taking advantage of the cover of the night, Poinsett put himself at the head of 400 picked men, with three pieces of light artillery, and, leaving the main body, marched directly to Talcahuano, whither the enemy had withdrawn. The town was immediately carried by storm and the detained whalemen were released.* Some of the ships having had their papers destroyed, Poinsett furnished them with consular certificates. The friendly regard for the United States which diplomatic address and persuasion had been unable to obtain, were secured in a much shorter time and probably far more efficaciously by force of arms, and Lima yielded to muskets and cannon the respect she had been unwilling to concede to the seal of the Department of State. Her depredations on American commerce did not, however, entirely cease until the advent of Captain Porter in those waters.† Soon after this the United States Government, realizing the defenseless condition of our commerce in the Pacific, dispatched Porter to that locality to protect our interests. Up to the time of the capture of his vessel he had not only done all in his power in this direction, but had effectually destroyed the English whale-fishery in those seas, and so turned the tables upon the enemy who had sent out his whale-ships well armed and manned to perform the same kindly office toward our whalemen.‡

Up to the latter part of the year 1813 the people of Nantucket had fished unmolested both for cod-fish and for humpback whales on the shoals at the eastward of the island, and by this means eked out a livelihood which was beginning to be quite precarious, but this resort was now taken from them. An English privateer, during the fall, appeared among

* See Nantucket Inquirer, August 9, 1824; also Inquirer and Mirror, September 14, 1872. In the latter paper is an account of the affair written by Captain Nathaniel Fitzgerald, one of the crew on one of the detained whalers.

† The Walker, of New Bedford, was captured by an English armed whale-ship, but recaptured by Porter. The Barclay, of New Bedford, also was captured by the Peruvians, and recaptured by Porter.

‡ So far as operations in the Pacific were concerned, the English went out to shear but "returned shorn." Wherever our sailors went ashore in foreign ports and met English seamen, a melee was a frequent occurrence. An amusing instance is related of the officer of a whaling-vessel incurring the displeasure of an English naval officer in one of the South American Pacific ports, by his zeal in behalf of his country. A challenge was the result. The American being the challneged party, had, of course, the right to a choice of weapons, and being most familiar with the harpoon, chose that. They met according to the preliminaries and took their positions. For a moment the English officer stood before the poised harpoon of our whaleman, then gave in, and the proposed combat was deferred.

the fleet, capturing one Nantucket vessel, and driving away the remainder. In this dilemma a town-meeting was assembled and a petition prepared and forwarded to Congress representing the situation there, and praying that some arrangement might be entered into "whereby the fisheries may be prosecuted, without being subject to losses by war."* But no adequate relief was afforded, and the people found the history of their sufferings during the Revolution repeating itself with a distressing pertinacity and fidelity, and they bade fair to perish of starvation and cold. They eventually succeeded in obtaining permission to import provisions, but attempts to get leave to sail on whaling voyages, coupled with immunity from capture, were unsuccessful.

The return of peace effected for them the protection that all negotiations had failed to secure. Early in February, 1815, news came to Nantucket that the war was over, and immediately all was hurry and bustle. The wharves, lately so deserted, teemed with life; the ships, lately dismantled, put on their new dress; the faces of the people, lately so disconsolate, were radiant with hope. In May two ships fitted and sailed on their voyages; by the last of June this number was increased to nine; by the 1st of August eighteen had gone, and by the 31st of December over thirty ships, brigs, schooners, and sloops were pursuing the leviathans in the North and South Atlantic, the Indian and Pacific Oceans. On the 9th of July, 1815, the first returning whaling-vessel arrived at Nantucket; in all probability this was the first arrival at any port in the United States after the war. This vessel was the sloop Mason's Daughter, which, after a six weeks' voyage, returned with 100 barrels of oil.

From this period the business rapidly increased in extent. Nantucket, which, during the war of 1812, had had its fleet of whale-ships reduced from forty-six to twenty-three, by the last of December, 1820, possessed seventy-two whale-ships, (with an aggregate of 20,449 tons,) besides several brigs, schooners, and sloops.† The same success which had

*November 26, 1813. Macy, 177. In an official report Captain Porter gives the following list of his captures, chiefly vessels, as he says, engaged in the British sperm-whale fishery:

†Journal of Obed Macy. See also Degrand's report. Degrand said: "When we consider the numerous other vessels engaged in the coasting and other commercial

advanced Nantucket so rapidly served to stimulate other ports, and New York, Long Island, New London, Cape Cod, Boston, and more particularly New Bedford, entered more vigorously into competition,* and but a few years elapsed before the latter port, which was an offshoot, a child as it were of Nantucket, had far outstripped the extremest growth of the parent. In the mean time the same love of adventure, the same longing to explore new fields, the same yearning to more speedily return home with a full cargo, that sent our whalemen from home to the West Indies and the Cape de Verdes, from the Cape de Verdes to the shores of Africa and Brazil, to the Falklands and the coast of Patagonia, from Patagonia to the Pacific coast of South America, urged them still further.† In 1818 Capt. George W. Gardner, in the ship Globe of Nantucket, steering west from the old track, found, in latitude 5° to 10° south and longitude 105° to 125° west, a cruising ground where the objects of his search seemed to exist in almost countless numbers. This he termed the "Off-shore Ground," and, within two years, more than fifty ships were whaling in the same locality.

The next cruising ground was off the coast of Japan. Having received word from Captain Winship, of Brighton, Mass., who had friends at Nantucket, that on a recent voyage from China to the Sandwich Islands he had seen large numbers of sperm-whales on that coast, Captain Joseph Allen, in the ship Maro, was dispatched there in the fall of 1819. In 1821 six or seven ships were cruising in this vicinity, and in the following year‡ more than thirty visited that field.

The grouping of whalemen upon the various grounds as they were discovered soon caused the slaughter or dispersion of the whales, and as a necessary consequence new fields must be opened up to supply the demand that had become rapacious. Since the close of the war of 1812, not only had the number of vessels in the various recognized whaling ports become greatly augmented, but every year witnessed the creation of new ports from whence this crusade against the whale was relentlessly pursued. Our vessels spread in their courses rapidly to all parts of the Pacific, and hundreds of islands received their first visit from

---

trade of the island; the small number of inhabitants it contains, and that the island itself is but a *speck* upon the bordering waters of our republic; and moreover, that almost the whole of their shipping was captured or destroyed so lately as the last war; we are struck with admiration at the invincible hardihood and industry of this little active, enterprising and friendly community, whose harpoons have penetrated with success every nook and corner of every ocean."—(Niles' Register, December 2, 1820.)

* This competition was also entered into by France and England, more particularly by the latter. (Macy, 214.)

† Capt. George Swain, 2d, of the ship Independence, which sailed from Nantucket in 1817, asserted, on the return from his voyage in 1819, that no ship would ever fill with sperm-oil again. A similar assertion had been made in 1789, when the ship Ranger, Captain William Swain, returned to Nantucket with a cargo of over 1,000 barrels of whale-oil. Her captain thought no other vessel would ever succeed in obtaining so large a cargo.

‡ The Maro returned in March, 1822, with 2,425 barrels of sperm-oil.

white men from the adventurous captors of these cetaceans.* The navigation of those waters was then a far different thing from what it at present is. The sea was comparatively unknown; what charts there were in existence were full of inaccuracies, and the first intimation that many a vessel had that she was sailing on dangerous ground was the splash of the breakers close at hand, or the grinding of her keel upon the treacherous rocks. Nor were the dangers of the seas the only risks which they experienced. The natives of many of the numerous groups of islands, with which the Pacific is so thickly studded, were more relentless than the waves, more treacherous than the reefs, and after the first emotions of surprise and awe the firing of a gun caused among them were over, woe to the ill-fated crew which fell into their clutches. It must be acknowledged that, in far too many cases, their barbarities were perpetrated in revenge for injuries received at the hands of some preceding ship's crew,† but they were not punctillious as to whether the actual culprit was punished or one of his kind—they warred against the race and not individuals. Many vessels carried with them the various gewgaws which would please the savage eye for the purpose of trading among the islands, and these, in cases where the natives were not sadly overreached, served to excite their cupidity and invite attack.

So large a portion of our fishing-fleet visited the Pacific that the United States was finally forced, when petition after petition had been sent to Congress, to send an exploring expedition to those seas, the ostensible purpose of which was to render the navigation of that ocean more secure as well in respect to the dangers of the land as in regard to those of the sea.

In 1828 four ships were sent from Nantucket to the coast of Zanzibar

*Hundreds of islands in the Pacific Ocean were first made known to civilization and first located upon charts by whalemen, and the captains of whale-ships were eagerly consulted when exploring expeditions to these seas were to be undertaken. Wilkes and Perry both were indebted to these hardy, adventurous mariners, and in the compilation of his great work on "Ocean Currents," Maury was in constant communication with them. That these favors reacted to the benefit of our whalemen is true; thus in December, 1858, Professor Agassiz, in a letter to the American Geographical Society, encouraged the Polar expedition then agitated in the following words: "I beg to add a word with regard to Dr. Hayes' Expedition,—I consider it as highly important, not only in a scientific point of view, but particularly so for the interests of the whale fisheries." He considered the habits of the whale as sure evidence of an open sea, "and the discovery of a passage into that open water which would render whale-fishing possible during the winter, would be one of the most important results for the improvement of whale-fishing."

†Thus Davis mentions (Nimrod of the Sea, p. 343) speaking a ship from London which had put in to the Marquesas Islands. While there three of the crew deserted. The captain of the English ship demanded of the chief that he return the deserters under reprisal, which demand was refused. Thereupon the master of the whaleman double-shotted his nine-pound guns, fired a round into the midst of the crowded grass huts composing the village, and carried off three of the Marquesans. "We Christians," continues Davis, "must not be unduly shocked when we hear of retaliation by

for sperm whales, and they cruised in the vicinity of the Seychelle Islands, and off the mouth of the Red Sea. Indeed, such was the vigor with which the new haunts were sought for that one adventurous captain even invaded the Red Sea itself in the pursuit of his occupation.*

In the year 1835 commenced that period of whaling which might be termed its Golden Age, for during the next decade the whale-fishery assumed its greatest importance and reached the zenith of its commercial value. In this year (1835) the ship Ganges of Nantucket, Barzillai T. Folger, master, took the first right whale ever taken on the Kodiak ground. This was the commencement of this fishery on the northwest coast. From this period the fleet rapidly augmented in size to the year 1846, when there belonged to the various ports of the United States 678 ships and barks, 35 brigs, and 22 schooners, with an aggregate capacity of 233,189 tons, and valued at $21,075,000.†

In 1843, the first bow-head whales taken in the North Pacific were captured on the coast of Kamschatka by the ships Hercules, Captain Ricketson, and Janus, Captain Turner, both of New Bedford.‡

In 1848, Captain Royce, in the bark Superior, of Sag Harbor, passed through Behring's Straits, and performed a good season's work. Being the first whaler in those seas he found the whales comparatively tame and easy to strike. In this high latitude,§ at the season of his whaling

---

the savages on the next ship's crew that falls into their power." And this atrocious treatment of the unoffending South Sea Islanders was by no means limited to English captains. Many seamen were eventually to be found upon these various Pacific islands who had deserted or been discharged from their ships. Some of them, scoundrels under any circumstances, became leaders of the natives in their attacks upon trading and whaling vessels; some of them became influential men upon the islands, both by means of their superior civilization and through marriage with dusky maidens—daughters of the chief men of the islanders. One of the most marked cases of this latter kind was that of David Whippey, who left a Nantucket whaling-vessel while at the Feejee Islands, about the year 1839, and, making himself friendly and useful to the chiefs, soon became a most important man among them. According to the custom there he acquired several wives, (albeit he is said to have left one behind him in Nantucket,) and became father of a numerous family. He was appointed one of the United States vice-consuls, and for many years was of great service to our Government.

* The ship Columbus. (Scammon's Marine Mammalia, p. 212.)

† The foreign whaling-fleet at this time numbered 230 vessels. (Scammon, 213.)

‡ Scammon, p. 213. Davis says (p. 388) the value of the "bow-head" whale was not at first recognized. According to his account Capt. George A. Covill, of New Bedford, first learned their value, and his discovery was somewhat accidental. For lack of sperm whales they struck one of this species in the Ochotsk, and killed him with but little trouble. Before cutting in they judged he would make about seventy barrels of oil, but to their surprise he turned out one hundred and fifty, with bone in proportion. There is some question as to this priority of Captain Covill's. Capt. J. H. Swift credits the French ship Asia with being the first, and Captain Royce advances the same claim for the American ship Huntsville. (See Scammon, note, p. 60.)

§ The following extract from the log of the Saratoga, of New Bedford, Capt. Harding, will serve to show to how high a northerly point whaling was pushed: "September 1, 1851, latitude 71° 40′ N., longitude 150° 40′ W.; 71 N., the depth of water was 6 fathoms.

there, the pursuit could be made at any hour of the twenty-four; in fact, the first whale taken was captured at 12 o'clock at night. The field thus opened was speedily vexed with the keels of our adventurous whalemen, and within the next three years two hundred and fifty ships had obtained cargoes of oil there. The season for Arctic whaling is short, and the pursuit of the whale at times extremely dangerous. Often, when struck, the wounded animal makes for the ice, and, unless killed before that barrier is gained, escapes with the harpoons and lines. Fogs are frequent and dense, and while these last the ringing of bells, firing of guns, blowing of horns, and pounding on empty casks, as the ships pierce through the mists, indicate their position as well to avoid collision with each other as to recall the missing boats, if any are out. It frequently happens that the crew of such a boat will fail to find their own ship, and will meet with some other; in which case they have no hesitation in repairing on board the stranger, there to remain until the fog lifts and they can find their own vessel.*

The fishery continued with varying success until the year 1847. Fluctuations in the business were constant, and with many ports the tide of success seemed to ebb and flow with quite as measured a rythm as the alternating rise and fall of old ocean. A few years of success overstimulated the business, new ships were added, and the natural result of overstocking the market and a fall in prices ensued. This was quite as much the case in 1830, when the imports of oil amounted

---

Proceeding to the northward and eastward the depth of water gradually increased to thirty fathoms. Experienced here severe gales, with a beat of 15 miles between packed ice, to the northward and eastward. In the bite saw whales in great numbers, gradually working north." Captain Beechey, in the Blossom, in 1826 reached 70° 30′, and explored with boats to 71° 25′. The Saratoga, therefore, went 15 miles farther north than the Blossom's boats. The following table taken from the Honolulu Friend of October 15, 1849, gives a record of thirteen Arctic whalers in the year, showing the amount of oil taken, the number of whales captured, the highest latitude attained, and the dates when the first and last whales were obtained:

Ship.	Barrels of oil.	Number of whales.	Highest latitude.	First whale.	Last whale.
Junior	1,900	11	66°	June 5	July 15
Jeannette	1,200	8	67° 40′	July 13	Aug. 14
Two Brothers	1,000	6	68° 10′	July 14	Aug. 26
Marengo	2,000	14	69°	June 25	Aug. 26
Metacom	1,600	13	67°	June 1	Aug. 15
Isaac Hicks	800	4	69° 50′	July 19	Aug. 14
Electra	350	2	67°	July 7	Aug. 10
Margaret	1,350	9	69° 30′	July 21	Aug. 3
J. Maury	1,000	7	68°	July 14	Aug. 23

Washington	1,800	16	68° 30′	June 28	Aug. 10
Omega	1,550	12	70° 12′	July 1	Aug. 25
Tiger	1,650	9	68° 40′	July 18	Aug. 30
Total	17,650	120			

*Scammon, p. 63. See, also, a very interesting series of articles by William H. Macy, esq., entitled "My Cruise in the Arctic," published in the Naut. Inq. and Mir., 1876.

to 106,829 barrels of sperm and 86,274 barrels of whale, as in 1845, when 157,917 barrels of sperm and 272,730 barrels of whale were brought in.* Then came losses, and as whales became more scarce and voyages were more prolonged and far more expensive, these reverses became more and more serious, until individual owners dropped out of the corporations, corporations became extinct in the ports, and finally the ports themselves became disconnected with the business.†

The war of the rebellion came with a suddenness that was entirely unexpected to the larger portion of the people of the North. The *ignis fatuus* of compromise beguiled them on with illusory hopes of peace, and when the storm finally burst it found them wholly unprepared. No special commercial interest was in a poorer state to withstand war than the whale-fishery. Ships were in various portions of the Pacific, on voyages averaging nearly four years, and were gone from port months at a time. If they were communicated with, the remedy was scarcely better than the disease. To go into port and there lay idle was quite as disastrous—even more so—to the owners than to continue their perilous calling at the hazard of capture by southern privateers.

But whalemen in the Pacific continued for several years unmolested. Those engaged in rebellion were unable to fit out the throng of privateers which their disposition prompted them to do. The first vessels of

* A similar and somewhat ludicrous case (as viewed in our present light) occurred in the early history of the cotton factory of the Boston Manufacturing Company. Not many years after its establishment, at one of the corporation dinners, a prominent director expressed great alarm arising from a dread that the mill at Waltham would prove an unfortunate speculation, because of its prospectively *overstocking the market* Then there were probably not half a dozen cotton factories in the country. The time is within the memory of people who are not yet what would be called old when the little town of Weston, in Massachusetts, could overstock the boot and shoe market of Boston.

In 1849, the English made an effort to revive the southern whale-fishery. Some merchants were incorporated under the name of "The British Southern Whale Fishery Company," and an attempt was made to establish a colony at the Auckland Islands, having in this company its recognized head, but dissensions arose as to jurisdictions, and the design fell through.

† In 1850, San Francisco became a whaling port. On the 13th of December of that year the Popmunnett (an old whaler) sailed from there on a whaling voyage to the Gallipagos Islands and coasts of Peru and Chili. The bark Sarah soon followed her on a sperm whaling voyage, intending to obtain a cargo and carry it to the Eastern States. In 1855, two stock companies were formed at Monterey and Crescent City for the prosecution of shore whaling. Boats were kept in constant readiness to put out in chase when a school of whales appeared. Quite a successful business was pursued in this way.

In January, 1858, the freighter, John Gilpin, with a large cargo of oil, was wrecked and sunk off Cape Horn. On the 1st of January, 1861, the Congress, of New Bedford, while cruising between Cape Leurwin and Bull Head, picked up a cask of oil, covered with barnacles, a relic of the wreck of the John Gilpin. In three years this cask had drifted east by north 7,780 miles. In February of the same year, 150 miles from New Holland, two other casks from the same cargo were picked up, having, in their three years of wandering, drifted from longitude 70° west to longitude 111° 15′ east.

the fleet to suffer from the depredations of such letters-of-marque as they were able to equip were three Atlantic whalers from Provincetown, the John Adams, Mermaid, and Parana, the first two schooners and the last a brig. They were captured when about 90 miles south of Balize, within the period of two hours, by the privateer Calhoun, formerly the tug-boat W. H. Webb, of New York. The vessels with their cargoes, about 215 barrels of sperm oil, were burned, and the sixty-three men composing their crews were taken to New Orleans and there left to shift for themselves.*

Several rebel privateers were soon cruising on the Atlantic whaling-grounds, and in the track of outward and homeward-bound Pacific whalers. They adopted a device to ensnare their victims, which can but be severely reprobated as inhuman. Capturing a vessel they waited until night had fallen upon the scene, and then, firing her, they pounced upon the unfortunates who, obeying the natural impulses of humanity, bore down for the burning craft to save the lives they believed to be endangered. In this way several whale-ships fell victims to this atrocious device.†

Naturally, with these risks staring them in the face, the owners were in no haste to refit such of their returning vessels as evaded rebel cruisers. Ships were sold, transferred to the merchant service, or laid up to await a change in affairs. Some in the Pacific were put under the Hawaiian flag. Of those sold, forty were purchased by the United States and formed the larger portion of the two famous stone fleets, which, in 1861, were sunk off the harbors of Charleston and Savannah to prevent the entrance of blockade-runners and the ingress and escape of privateers.‡

---

* In 1861.

† Thus were captured and burned by the Alabama the ships Benjamin Tucker, Osceola, Virginia, and Elisha Dunbar, of New Bedford, Ocean of Sandwich, Alert of New London, and schooners Altamaha of Sippican and Weather Gage of Provincetown, all of whom, attracted by the burning of the Ocean Rover of Mattapoisett, hastened to rescue the shipmates whose lives they believed to be imperilled.

‡ Among these vessels were several famous China and European merchantmen. The Herald, formerly of Boston, was nearly one hundred years old. (F. C. S., in Boston Advertiser, December 20, 1871.) Another famous ship was the Corea, which was formerly an armed store-ship belonging to the English navy, and came to this country during the Revolution loaded with stores. A storm arising, she sought shelter in Long Island Sound. This fact soon became known to our Yankee fishermen, and they determined to capture her, and accordingly about a hundred of them, well armed, left New Bedford in a small vessel for that purpose. Coming within sight of the Corea all hands, except four men and a boy, were sent below, the vessel soon reached the fishing-ground, and, to all appearance, the five on deck were soon engaged in innocent piscatorial employments. The Corea ran down toward them and fired a gun, at which summons our fishermen stood for the storeship, and coming within hail were ordered alongside. Grumblingly they obeyed and were despoiled of their fish, while the Corea's crew crowded around curious to see the prize. At this juncture one of the captive fishermen threw some fish out of one of the ports upon the schooner's deck and at the signal the secreted men swarmed up from below. Before the astonished

In 1865 the privateer steamer Shenandoah entered the Pacific Ocean, and on the 26th of June she captured and burned five ships and barks in Behring's Straits.* On the 27th of June the ship Brunswick, of New Bedford, having got jammed in the ice, those of the fleet that were near went to her assistance. The wind dying away, they anchored close to each other. The next morning the Shenandoah appeared upon the scene and captured and destroyed nine of them. Among these was the bark Favorite, of Fairhaven, Capt. Thos. G. Young, a man between sixty and seventy years of age, but full of courage and determination. It was no part of his creed to see his ship (in which he was part owner) given up without a struggle, however great the odds or however hopeless the resistance. Accordingly he loaded all his bomb-guns and firearms and took a position on the cabin roof. As the Shenandoah's boat came alongside he ordered her officer to "stand off," an order which, when he saw the look of mischief in the captain's eye, he prudently obeyed, and lost no time in returning to his vessel to report his lack of progress. The commander of the privateer had perceived the action of the boat, and ordered a gun trained upon the whaler and that his gunner should fire low. In the mean time the officers of the Favorite, deeming resistance as worse than useless, urged Captain Young to desist, assuring him that it was only a fruitless sacrifice of his life, to which the captain replied that he would die willingly if he could but shoot Waddell, who commanded the Shenandoah. Finding remonstrance useless, the officers secretly removed the caps from the loaded arms, removed the ammunition not already in the guns, and took to the boats, leaving the heroic old captain to defend the castle, in which his entire property was invested, alone.

The gun from the Shenandoah was not discharged, as the returning boat was in range; and when it had reached the steamer Waddell had changed his mind, and ordered another boat to capture the obdurate skipper. As she came alongside, the officer in charge ordered Captain Young to haul down his colors. In language more forcible than polite

---

Englishmen could recover their senses their vessel was a prize. She was taken to New Bedford and discharged, and some years after the war she was added to the whaling fleet. The first "stone fleet" consisted of the Archer, Courier, Cossack, Frances, Henrietta, Garland, Herald, Kensington, Leonidas, L. C. Richmond, Maria Theresa, and South America of New Bedford, Amazon, Harvest, and Rebecca Sims of Fairhaven, Potomac of Nantucket, American of Edgartown, Corea, Fortune, Lewis, Phœnix, and Tenedos of New London, Meteor and Robin Hood of Mystic, and Timor of Sag Harbor. In the second fleet were the following whalers: America, Edward, India, Valparaiso, and Majestic of New Bedford, Montezuma, New England, and Dove of New London, Mechanic and William Lee of Newport, Emerald and Noble of Sag Harbor, Messenger of Salem, and Newburyport of Gloucester. Many of these had been noted ships in their prime; some of them European packets, others in the China trade, &c.

* The Isabella, Gypsey, Catharine, General Williams, and Wm. C. Nye. Those captured on the 27th were the Hillman, Isaac Howland, Nassau, Brunswick, Waverly, Martha 2d, Congress, Favorite, and Covington.

he replied, "I'll see you d——d first." "If you don't," said the officer of the boat, "I'll shoot you." "Shoot and be d——d," returned the imperturbable Young. The crew of the boat were now ordered to board the Favorite; and as the captain pulled the trigger to his gun and ineffectually endeavored to explode the charge, he saw the defenceless condition in which he had been left, and realized that he had nothing to do but to surrender. His inhuman captors, who were unable to appreciate bravery, put him in irons in the topgallant forecastle, and robbed him of his money, his watch, and even of his shirt-studs.

Capt. Ebenezer F. Nye, of the ship Abigail, of New Bedford, which ship was also captured and burned in the Ochotsk Sea by the Shenandoah in June, manned two boats before his ship was in the privateer's possession, and started for the rest of the fleet to warn them of the impending danger.

In all, the Shenandoah captured and burned thirty-four ships and barks, and captured and bonded the Milo, the General Pike, and the James Maury, of New Bedford, and the Nile, of New London.

During the war for the maintenance of our national integrity, the seaport towns responded with the utmost alacrity to the calls for men and for money. Our gallant whalemen hastened to defend the flag, and enlisted in large numbers in the Navy as more congenial with their inclinations. A large portion of the officers in this branch of our service had gathered their experience on the deck of a whaler, and tested their courage in a whale-boat; and it is safe to assert that no braver men defended and no more experienced seamen navigated those castles of oak and of iron that sustained in these later years the renown our Navy won in the war of 1812.*

The rebellion over, renewed activity took place in the whaling world. Ships that had been laid up were rigged and sent away, and new ships were again added to the fleet. The business was carried on with caution, for the inroads made upon the trade by the general use of coal-oils were becoming matters of serious consideration.

In the fall of 1871 came news of a terrible disaster to the Arctic fleet, rivaling in its extent the depredations of the rebel cruiser. Off Point Belcher thirty-four vessels lay crushed and mangled in the ice; in Honolulu were over twelve hundred seamen who by this catastrophe were shipwrecked.

Early in May the fleet arrived south of Cape Thaddeus, where they found the ice closely packed, and the wind blowing strong from the northeast.† This state of affairs continued during the most of the

* A meeting of the whaling-agents in Payta was held, at which they offered both money and personal service in support of the Union. The whalemen were at this time advised to cruise in companies.

† Harper's Weekly, December 2, 1871.

The following table, copied from the New Bedford Shipping List, will show the number of vessels in the North Pacific each year, and the rise and decline of the fishery in

month. June came in with light and variable winds and foggy weather; but the ice opening somewhat, the ships pushed through in sight of Cape Navarine, where they took five or six whales, and for a short time heard many more spouting among the ice. About the middle of June the ice opened still more, and the fleet passed on through Anadir Sea, taking a few whales as they went. By the 30th of June the vessels had passed through Behring's Straits, preceded by the whales. Waiting the further breaking up of the ice, they commenced catching walruses, but with comparatively poor success. During the latter part of July, the ice disappearing from the east shore south of Cape Lisburne, the fleet pushed on to the eastward, following the ice, the principal portion of which was in latitude 69° 10′. A clear strip of water appearing on the east shore, leading along the land to the northeast, they worked along through it to within a few miles of Icy Cape. Here some of the vessels anchored, unable to proceed farther on account of the ice lying on Blossom Shoals.

About the 6th of August the ice on the shoals started, and several ships got under way. In a few days most of the fleet was north of the shoals, and, aided by favorable weather, they worked to the northeast as far as Wainwright Inlet, eight vessels reaching there on the 7th. Here the ships either anchored or made fast to the ice, which was very heavy and densely packed, and whaling was carried on briskly for several days, and every encouragement was given for a favorable catch. On the 11th of August a sudden change of wind set the ice inshore, catching a large number of boats which were cruising for whales in the open ice, and forcing the ships to get under way to avoid being crushed. The vessels worked inshore under the lee of the ground ice, and succeeded, despite the difficulties of the situation, in saving their boats by hauling them for long distances over the ice, some of them, however, being badly stoven. On the 13th the ice grounded, leaving a narrow strip of water along the land up to Point Belcher. In this open water lay the fleet anchored or fast to the ice, waiting for the expected northeast wind that

those seas. The locality includes the water between the Asiatic and American coasts north of 50° north latitude:

Year.	No. of ships.	Average barrels.	Total barrels.	Year.	No. of ships.	Average barrels.	Total barrels.

was to relieve them of their icy barrier, whaling constantly being carried on by the boats, though necessarily under many adversities.

On the 15th of August the wind came around to the westward, driving the ice still closer to the shore and compelling the vessels to work close in to the land. The drift of the ice inland was so rapid that some of the vessels were compelled to slip their cables, there being no time to weigh anchor. By this event the fleet was driven into a narrow strip of water not over half a mile in width at its widest part. Here, scattered along the coast for 20 miles, they lay, the water from 14 to 24 feet deep, and ice as far as the lookouts at the mastheads could see. Whaling was still carried on with the boats off Sea-Horse Island and Point Franklin, although the men were obliged to cut up the whales on the ice and tow the blubber to the ships.

On the 25th a strong northeast gale set in and drove the ice to a distance of from four to eight miles off shore, and renewed attention was given to the pursuit of the whale. Up to this time no immediate danger had been anticipated by the captains beyond that incidental to their usual sojourn in these seas. The Esquimaux, nevertheless, with the utmost friendliness, advised them to get away with all possible speed as the sea would not again open, but this was contrary to the Arctic experience of the whalemen, and they resolved to hold their position.

On the 29th began the series of conflicting circumstances resulting in the destruction of the fleet. A southwest wind sprang up, light in the morning, but freshening so toward evening that the ice returned inshore with such rapidity as to catch some of the ships in the pack. The rest of the fleet retreated ahead of the ice, and anchored in from three to four fathoms of water, the ice still coming in and small ice packing around them. The heavy floe-ice grounded in shoal-water and between it and the shore lay the ships, with scarcely room to swing at their anchors.

On the 2d of September the big Comet was caught by the heavy ice and completely crushed, her crew barely making their escape to the other vessels. She was pinched until her timbers all snapped and the stern was forced out, and hung suspended for three or four days, being in the mean time thoroughly wrecked by the other vessels; then the ice relaxed its iron grip and she sunk. Still our hardy whalemen hoped that the looked-for northeasterly gale would come, and felt greater uneasiness on account of the loss of time than because of their present peril. Their experience could not point to the time when the favoring gale had failed to assure their egress. Nothing but ice was visible offshore, however, the only clear water being where they lay, and that narrowed to a strip from 200 yards to half a mile in width, and extending from Point Belcher to two or three miles south of Wainright Inlet. The southeast and southwest winds still continued, light from the former and fresh from the latter direction, and every day the ice packed more and more closely around the doomed vessels.

On the 7th of September the bark Roman, while cutting-in a whale, was caught between two immense floes of ice off Sea-Horse Islands, whence she had helplessly drifted, and crushed to atoms, the officers and crew escaping over the ice, saving scarcely anything but their lives.

The next day beheld the bark Awashonks meet a similar fate, and a third fugitive crew was distributed among the remaining ships. The peril was now apparent to all; the season was rapidly approaching the end; the ice showed no signs of starting, but on the contrary the little clear water that remained was rapidly filling with ice and closing around them. Frequent and serious were the consultations held by the captains of the beleagured vessels. One thing at least was evident without discussion; if the vessels could not be extricated the crews must be got away before winter set in, or the scanty stock of provisions they had could only postpone an inevitable starvation. As a precautionary measure, pending a decision on the best course to adopt, men were set to work to build up the boats, that is, to raise the gunwales so as to enable them the better to surmount the waves. Shoes* were also put on them to prevent, as far as possible, injury from the ice. The brig Kohola was lightened in order to get her over the bar at Wainwright Inlet, upon which there were only 5 or 6 feet of water. Her oil and stores were transferred to the deck of the Charlotte, of San Francisco, but when discharged it was found that she still drew 9 feet of water, and the attempt to get her over the shoal water was abandoned.† An expedition of three boats, under the command of Capt. D. R. Frazer, was now sent down the coast to ascertain how far the ice extended; what chances there were of getting through the barrier; what vessels, if any, were outside, and what relief could be relied upon. Captain Frazer returned on the 12th, and reported that it was utterly impracticable to get any of the main body of the fleet out; that the Arctic and another vessel were in clear water below the field, which extended to the south of Blossom Shoals, 80 miles from the imprisoned crafts; and that five more vessels, then fast in the lower edge of the ice, were likely to get out soon. He also reported, what every man then probably took for granted, that these free vessels would lay by to aid their distressed comrades. It is a part of the whaleman's creed to stand by his mates. On hearing this reported, it was decided to abandon the fleet and make the best of their way, while they could, to the rescuing vessels. It was merely a question whether they should leave their ships and save their lives, or stand by their ships and perish with them.

The morning of the 14th of September came, and a sad day it was to the crews of the ice-bound crafts. At noon the signals, flags at the mast-heads, union down, were set, which told them the time had come

* A sheathing—in this case copper—being used.

† The same experiment, with the same result, was tried by Captain Redfield, of the brig Victoria. The Kohola and Victoria are rated as barks in a succeeeding page.

when they must sever themselves from their vessels.* As a stricken family feels when the devouring flames destroy the home which was their shelter, and with it the little souvenirs and priceless memorials which had been so carefully collected and so earnestly treasured, so feels the mariner when compelled to tear himself from the ship which seems to him at once parent, friend, and shelter. In these vessels lay the result of all the toil and danger encountered by them since leaving home. Their chests contained those little tokens received from or reserved for friends thousands of miles away, and nothing could be taken with them save certain prescribed and indispensable articles. With heavy hearts they entered their boats and pulled away, a mournful, almost funereal, flotilla, toward where the vessels lay that were to prove their salvation. Tender women and children were there who, by their presence, sought to relieve the tedium of a long voyage to their husbands and fathers, and the cold north wind blew pitilessly over the frozen sea, chilling to the marrow the unfortunate fugitives.

The first night out the wanderers encamped on the beach behind the sand-hills. A scanty supply of fire-wood they had with them and such drift-wood as they could collect sufficed to make a fire to protect them somewhat from the chilling frost. The sailors dragged boats over the hills, and by turning them bottom upward and covering them with

---

*The following protest was written on the 12th of September, and signed by all the captains on the following day before abandoning their vessels:

"POINT BELCHER, *Arctic Ocean, Sept.* 12, 1871.

"Know all men by these presents, that we, the undersigned, masters of whale-ships now lying at Point Belcher, after holding a meeting concerning our dreadful situation, have all come to the conclusion that our ships cannot be got out this year, and there being no harbor that we can get our vessels into, and not having provisions enough to feed our crews to exceed three months, and being in a barren country, where there is neither food nor fuel to be obtained, we feel ourselves under the painful necessity of abandoning our vessels, and trying to work our way south with our boats, and, if possible, get on board of ships that are south of the ice. We think it would not be prudent to leave a single soul to look after our vessels, as the first westerly gale will crowd the ice ashore, and either crush the ships or drive them high upon the beach. Three of the fleet have already been crushed, and two are now lying hove out, which have been crushed by the ice, and are leaking badly. We have now five wrecked crews distributed among us. We have barely room to swing at anchor between the pack of ice and the beach, and we are lying in three fathoms of water. Should we be cast on the beach it would be at least eleven months before we could look for assistance, and in all probability nine out of ten would die of starvation or scurvy before the opening of spring.

"Therefore, we have arrived at these conclusions: After the return of our expedition under command of Capt. D. R. Frazer, of the Florida, he having with whale-boats worked to the southward as far as Blossom Shoals, and found that the ice pressed ashore the entire distance from our position to the shoals, leaving in several places only sufficient water for our boats to pass through, and this liable at any moment to be frozen over during the twenty-four hours, which would cut off our retreat, even by the boats, as Captain Frazer had to work through a considerable quantity of young ice during his expedition, which cut up his boats badly."

(Signed by the masters.)

sails, made quite comfortable habitations for the women and children. The rest made themselves comfortable as best they could.

"On the second day out," says Captain Preble, "the boats reached Blossom Shoals, and there spied the refuge-vessels lying five miles out from shore, and behind a tongue of ice that stretched like a great peninsula ten miles farther down the coast, and around the point of which the weary crews were obliged to pull before they could get aboard. The weather here was very bad, the wind blowing fresh from the southwest, causing a sea that threatened the little craft with annihilation. Still the hazardous journey had to be performed, and there was no time to be lost in setting about it. * * * * All submitted to this new danger with becoming cheerfulness, and the little boats started on their almost hopeless voyage, even the women and children smothering their apprehensions as best they could. On the voyage along the inside of the icy point of the peninsula everything went moderately well; but on rounding it, they encountered the full force of a tremendous southwest gale and a sea that would have made the stoutest ship tremble. In this fearful sea the whale-boats were tossed about like pieces of cork. They shipped quantities of water from every wave which struck them, requiring the utmost diligence of all hands at bailing to keep them afloat. Everybody's clothing was thoroughly saturated with the freezing brine, while all the bread and flour in the boats was completely spoiled. The strength of the gale was such that the ship Arctic, after getting her portion of the refugees on board, parted her chain-cable and lost her port anchor, but brought up again with her starboard anchor, which held until the little fleet was ready to sail."

By four o'clock in the afternoon of the second day all were distributed among the seven vessels that formed the remnant of the fleet that sailed for the Arctic Ocean the previous spring. Not a person was lost to add to the grief already felt or to increase the gloom of their situation. To the Europa was assigned 280; to the Arctic, 250; to the Progress, 221; to the Lagoda, 195; to the Daniel Webster, 113; to the Midas, 100; and to the Chance, 60: in all 1,219 souls in addition to their regular crews. On the 24th of October the larger portion of these vessels reached Honolulu, and the remaining ones of the seven speedily followed.*

* The names of the beleaguered fleet were: from New Bedford, barks Awashonks, value, $58,000; Concordia, $75,000; Contest, $40,000; Elizabeth, $60,000; Emily Morgan, $60,000; Eugenia, $56,000; Fanny, $58,000; Gay Head, $40,000; George, $40,000; Henry Taber, $52,000; John Wells, $40,000; Massachusetts, $46,000; Minerva, $50,000; Navy, $48,000; Oliver Crocker, $48,000; Seneca, $70,000; William Rotch, $43,000; ships George Howland, $43,000; Reindeer, $40,000; Roman, $60,000; Thomas Dickason, $50,000. From New London, bark J. D. Thompson, value $45,000, and ship Monticello, $45,000. From San Francisco, barks Carlotta, value $52,000; Florida, $51,000; and Victoria, $30,000. From Edgartown, ships Champion, value $40,000, and Mary, $57,000. And from Honolulu, Sandwich Islands, barks Paira Kohola, $20,000; Comet, $20,000; and Victoria 2d and ship Julian, $40,000. The Honolulu vessels had generally American owners, having been placed under the Hawaiian flag to protect them from rebel cruisers.

Capt. William H. Kelley, who commanded the Gay Head, visited the locality the

On the receipt of the news of this disaster, more particularly in New Bedford, great excitement was occasioned. The value of the wrecked vessels sailing from that port alone exceeded, with their cargoes, one million of dollars. But the owners of whaling-vessels were not the men to yield supinely to a single misfortune, however overpowering it might seem, and the ensuing year twenty-seven ships were busy in the Arctic, and in 1873 twenty-nine visited that precarious sea.

Still whaling in general continued to decline. The sun of its destiny was moving toward its western horizon. Whether some modern Joshua shall command it to stand still, or whether it shall move still nearer its full setting, is yet uncertain. Some oil will still be used until its perfect substitute is produced at so low a rate that the expenses of whaling will entirely absorb its profits.

On the 1st of January, 1877, the entire fleet was reduced to 112 ships and barks, and 51 brigs and schooners, having a total capacity of 37,828 tons.*

Before closing this chapter it would be well to see to what causes this decline is attributable. Many circumstances have operated to bring this about. The alternate stimulus and rebuff which the fishery received as a short supply and good prices led to additions to the fleet and an overstock and decline in values, were natural, and in themselves probably

following year, and wrote home the condition of such of the vessels as still remained. The Minerva lay at the entrance to Wainwright Inlet, as good in hull as when abandoned. The T. Dickason lay on her beam-ends on the bank, bilged and full of water The Seneca was dragged by the ice up the coast some distance; her bowsprit was gone bulwarks stove, and rudder carried away, and she was frozen in solid. The Reindeer sank, and the Florida was ashore on Sea-Horse Islands, burned to the water's edge. The rest of the fleet were either carried away by the ice, crushed to pieces, or burned by the natives. The Gay Head and Concordia were burned where they lay. "The bark Massachusetts went around Point Barrow. There was one white man on board her who staid up here last winter. He made his escape over the ice this summer, and was five days getting back to the ships. He was about used up when they found him this summer. The natives set out to kill him, but the women saved him, and afterward the old chief took care of him. He saved a large quantity of bone, but the natives took it away from him, except a small quantity. He said $150,000 would not tempt him to try another winter in the Arctic. He said that four days after we left the ships last year the water froze over and the natives walked off to the ships; and fourteen days after there came on a heavy northeast gale and drove all but the ground-ice away, (that never moved.) Shortly after there blew another northeast gale, and he said that of all the butting and smashing he ever saw, the worst was among those ships driving into each other during those gales. Some were ground to atoms, and what the ice spared the natives soon destroyed, after pillaging them of everything they pleased."

Since writing the account of the disaster of 1871, the reports have been received of another of less pecuniary extent but more appalling in its effect on human life. The fleet for 1876 consisted of twenty ships and barks. Of these, twelve are reported lost or abandoned in the Arctic. Much of the melancholy story seems a duplicate description of that of 1871. Again the fleet had entered that fatal ocean early in August, and again commenced the season's whaling with prospect of fair success; again the ice com-

* The lowest ebb was reached on the 1st of January, 1875, when the fleet consisted of 119 ships and barks, and 44 brigs and schooners, with a capacity of 37,733 tons.

formed no positive impediment. The increase in population would have caused an increase in consumption beyond the power of the fishery to supply, for even at the necessarily high prices people would have had light. But other things occurred. The expense of procuring oil was yearly increasing when the oil-wells of Pennsylvania were opened, and a source of illumination opened at once plentiful, cheap, and good. Its dangerous qualities at first greatly checked its general use, but, these removed, it entered into active, relentless competition with whale-oil, and it proved the more powerful of the antagonistic forces.

The length of voyages increased from two years for a cargo of sperm and from nine to fifteen months for a cargo of whale oil to four years to fill with the latter, while the former was practically abandoned as a separate business * after it became necessary to make voyages of four, five, and even six years, and then seldom return with a full cargo. As a matter of necessity the fitting of ships became far more expensive,†

menced closing around them; again they cherished delusive hopes that a strong gale would drive it off-shore and afford them a means of escape, and again these hopes were doomed to a bitter disappointment. Again the masters decided it was necessary to abandon their vessels, and again the abandonment was accomplished. Here the parallel ceases. Several men perished from exposure in journeying from one beleaguered vessel to another apparently more safe, and many died on the toilsome, perilous march and voyage to the rescuing ships. Many more preferred to stay by the ships and risk their chances of surviving during the terrible Arctic winter to assuming the nearer and, to them, apparently no less dangerous alternative of an immediate escape. These men are still there, and there seems no feasible way to communicate with them until the summer of 1877. Judging by the experience of Arctic navigators and by the condition of several of the former abandoned fleet when found in the ensuing season, their chance for a comfortable survival seems good, unless attacked by the avaricious natives. Provisions and fuel are reported amply sufficient for them, and with the first clear water of 1877 ready hands and willing hearts will hasten to their assistance. Fifty-three men remained, and three hundred made their escape. The names of the lost and abandoned vessels with their approximate values, not including cargoes, are as follows: (Of these the Arctic is reported lost; the others abandoned.) From New Bedford, the Acors Barns, $36,000; Camilla, $36,000; Cornelius Howland, $40,000; James Allen, $36,000; Java 2d, $26,000; Josephine, $40,000; Marengo, $40,000; Mount Wollaston, $32,000; Onward, $40,000; and St. George, $36,000. From San Francisco, the Clara Bell, $24,000. And from Honolulu, the Arctic, $32,000, and Desmond, $24,000. A total loss of $442,000. The estimated value of reported cargoes is about $375,000 more.

* Always excepting, of course, Atlantic whalers. Sperm-whaling in the Atlantic has always been pursued by the bulk of the Provincetown vessels and by quite a fleet of schooners and brigs from other ports. There is an occasional revival of this pursuit in larger vessels at intervals of a few years, at present some of the most successful voyages being made by ships and barks cruising for sperm whales in this ocean.

† The cost of fitting of late years has grown out of all proportion to the value of the return. Thus, in 1790, a ship carrying 1,900 barrels of oil would be fitted for a two-years' sperm whaling voyage to the Pacific Ocean for $12,000, while in 1858, with a doubled capacity, the length of the average voyage was more than doubled, and the cost of fitting had increased to about $65,000. But few people have an idea of the amount and variety of occupations to which the fitter-out of a whale-ship pays tribute. In 1765 the schooner Lydia, of Edgartown, Capt. Peter Pease, used the following articles in fitting for her whaling-cruise: 5 barrels beef, 6 barrels pork, 1,200 pounds bread, 60 pounds butter, 3 small cheeses, 500 pump-nails, 2 wine-glasses, 600 board-nails, 1,500 shingle-nails, 24 deck-nails, 30 spikes, 1 mallet, 1 dipsy-line, 2 scrapers, 1 adze, 2

a rivalry in the furnishing adding perhaps considerably to the outlay. Vessels were obliged to refit each season at the various islands in the Pacific, usually at the port of Honolulu when passing in its vicinity, and the bills drawn upon the owners on these occasions were so enor-

axes, 5 spades, 1 tunnel, 4 barrels flour, 12 bushels corn, 14 bushels meal, 100 pounds rice, 2 barrels rum, 55 gallons molasses, 20 pounds candles, 314 feet boards, 230 feet boat-boards, 600 fathoms tow-line, 130 fathoms main-warp, 28 guns, 12 lances, 3 cod-lines, 2 log-lines, 6 gimlets, 3 skeins twine, 6 bowls, 6 knives and forks, 6 plates, 4 pounds tea, 5 pounds chocolate, 15 pounds coffee, 100 pounds sugar, 50 pounds hog's-fat, 5 bushels beans, 1 platter, 2 brooms, 2 hour-glasses, 1 lantern, 50 pounds spun yarn, 4 pump-bolts, 3 pump-brakes, 6 upper boxes, 4 lower boxes, 1 pump-hook, 1 draw-bucket, 2 cedar pails, 1 hand-pump, 2 finishing-planes, 1 pound pepper, 1 speaking-trumpet, 2 half-minute glasses, 1 punch-bowl, 6 tea-cups and saucers, 1½ pounds powder and shot, 1 drawingknife, 1 candlestick, 3 skeins marling, 3 skeins housing, 8 spare blocks, 1 cat-block, 40 fathoms spare rigging, 1 sounding-lead, 1 boat-hook, 12 sail-needles, 18 yards mending-cloth, 1 penknife, 1 jackknife, 10 pounds chalk, 1 bung-borer, 3 chisels, 1 handsaw, 1 large hammer, 1 pump-hammer.

The ship Beaver, of Nantucket, which sailed for a Pacific sperm whaling voyage in 1791, cost, with her outfit, $10,212. She was a ship of 240 tons, carried 17 men, and required in outfitting, among other articles, 400 iron-hooped casks (this was before iron came into general use for this purpose, and the remainder of her casks, to the capacity of 1,400 barrels, were wooden-hooped), 40 barrels of salt provisions, 3½ tons bread, 30 bushels beans and peas, 1,000 pounds of rice, 40 gallons molasses, 24 barrels of flour. All the additional provisions used were 200 pounds of bread. She made a seventeen-months' voyage.—(Macy.)

The whaling-fleet in 1831 consisted of about 290 ships and barks, (170 sperm and 120 right whalers.) This fleet required in outfitting, among other things, 36,000 barrels of flour, 30,000 barrels of beef and pork, 18,000 bolts of duck, 3,000 tons of hoop-iron, 6,000,000 staves, 2,000 tons cordage, besides large quantities of iron, (for harpoons, lances, spades, blubber-hooks, and camboose-grates,) molasses, rice, beans, peas, corn, tea, coffee, sugar, &c. The annual consumption of copper amounted to 700,000 pounds.

It has been said, and probably with a very great degree of truth, that the "whaling-fleet made Honolulu," and when one considers for how many years large fleets of whalemen (formerly English, French, and American, but latterly exclusively from the latter country,) rendezvoused there, the known prodigality of the sailor, and the increasingly heavy bills for refitting, of all of which Honolulu reaped the benefit, it is easy to believe the statement. Several merchants removed thence also from the United States and purchased and fitted whaling-vessels from that port, the first whaler belonging to Honolulu being fitted in 1832 by Henry A. Pierce, of New Bedford.

The principal articles used in fitting out the whaling-fleet sailing from New Bedford alone in 1858, 65 ships, amounted in gross to $1,950,000, and included 13,650 barrels flour, 260 of meal, 10,400 of beef, 7,150 of pork, 19,500 bushels of salt, 97,500 gallons molasses, 39,000 pounds rice, 1,300 bushels beans, 39,000 pounds dried apples, 78,000 of sugar, 78,000 of butter, 19,500 of cheese, 16,300 of ham, 32,500 of cod-fish, 18,000 of coffee, 14,300 of tea, 13,300 of raisins, 1,950 bushels corn, 2,600 of potatoes, 1,300 of onions, 400 barrels vinegar, 2,000 pounds sperm-candles, 32,500 barrels fresh water, 1,200 cords oak wood, 260 of pine, 1,000,000 staves, 260,000 feet heading, 1,000 tons iron hoops, 33,000 pounds rivets, 520,000 pounds sheathing-copper and yellow-metal, 15,000 of sheath-nails, 52,000 of coppering nails, 400 barrels tar, 739,000 pounds cordage, 450 whale-boats, 32,500 feet boat-boards, 65,000 feet pine boards, 36,000 feet oars, 8,500 iron poles, 22,500 pounds flags, 23,000 bricks, 200 casks lime, 205,000 yards canvas, 13,000 pounds cotton-twine, 234,000 yards assorted cotton-cloth, 130,000 pounds tobacco, 39,000 gallons white lead, 5,200 pounds linseed-oil, 400 gallons turpentine, 13,000 pounds paints, 2,600 gallons new rum, 1,000 gallons other liquors, 120 casks powder, besides clothing, &c. The advance-wages alone amounted to $130,000.

mous as to call forth loud and frequent complaints;* and in later years the only available western fishery was in the North Pacific and Arctic Oceans, where disasters were the rule and immunity from them the exception, thereby incurring, when the vessels were not lost, heavy bills for repairs, besides the ordinary ones of refitting.

Again, during the later days of whaling, more particularly immediately after the discovery of the gold mines in California, desertions from the ships were numerous and often causeless, generally in such numbers as to seriously cripple the efficiency of the ship. In this way large numbers of voyages were broken up and hundreds of thousands of dollars were sunk by the owners. During a portion of the time many ships were fired by their refractory and mutinous crews, some of them completely destroyed, others damaged in amounts varying from a few hundred to several thousand dollars. Crews would apparently ship simply as a cheap manner of reaching the gold mines, and a ship's company often embraced among its number desperadoes from various nations, fit for any rascality which might best serve them to attain their end. They took no interest in the voyage, nor cared aught for the profit or loss that might accrue to the owners. In order to recruit, it became necessary, particularly during the ten years next succeeding the opening of the gold mines, to offer heavy advance-wages, and too often these were paid to a set of bounty-jumpers, as such men were termed in the Army during the late war, who only waited the time when the ship made another port to clandestinely dissolve connection with her and hold themselves in readiness for the next ship. Unquestionably there were times when men were forced to desert to save their lives from the impositions and severity of brutal captains, but such cases were undoubtedly very rare. Formerly the crews were composed almost wholly of Americans, but latterly they were largely made up of Portuguese shipped at the Azores, a mongrel set shipped anywhere along the western coast of South America, and Kanakas shipped at the Pacific islands. There were times, when the California fever was at its highest, that the desertions did not stop with the men, but officers and even captains seem to vie with the crew in defrauding the men from whose hands they had received the property to hold in charge and increase in value.

Another source of loss was, strangely enough, to be found in the

*The increased cost of refitting has for years been a source of serious concern to ship-owners. A meeting of agents was held in New Bedford, in February, 1860, to take some action in regard to this evil. Among the things complained of, besides the enormous charges, were the extortions of consuls, the decisions of the courts of admiralty, the inducements offered to sailors to desert, &c. The New London Star, in 1859, said that in order to make whaling profitable business must be done where the vessel is owned, not one-fourth in New London and three-fourths in Honolulu; however poorly a ship did in the aggregate, Honolulu fared just as well. "All the business must be done in the home port to make it profitable, and the sooner whaling-merchants withdraw their ships from the Sandwich Islands the better it will be for all concerned. The deluge of oil that is thrown into the eastern market by holding it at the islands until some freighter wants a cargo, and then sending it home, operates with great detriment to the holders of oil at the home ports."

course of the consular agents sent out by our Government to protect the interests of our whalemen. Many and bitter were the complaints at the extortionate charges and percentages demanded by many of these men.*

As another important source of the decline in this business must be regarded the scarcity and shyness of whales. Prior to the year 1830, a ship with a capacity for 2,000 barrels would cruise in the Pacific Ocean and return in two years with a cargo of sperm-oil. The same ship might go to Delago or Woolwich Bay and fill with whale-oil in about fifteen months, or to the coast of Brazil and return in nine months full of the oil peculiar to the whales of those seas; but, as has been previously remarked, this has all changed, and the length of the voyage has become entirely disproportioned to the quantity of oil returned.

Briefly, then, this is the case. Whaling as a business has declined; 1st, from the scarcity and shyness of whales, requiring longer and more expensive voyages; 2d, extravagance in fitting out and in refitting; 3d, the character of the men engaged; 4th, the introduction of coal-oils.

Of late years sperm whaling in the Atlantic Ocean has been revived with some success, but the persistency with which any field is followed up, makes its yield at least but temporary. It may perhaps be a question worthy of serious consideration whether it is policy for the United States Government to introduce the use of coal-oils into its light-house and similar departments, to replace the sperm-oil now furnished from our whaling ports, and thus still further hasten the ultimate abandonment of a pursuit upon the resources of which it draws so heavily in the day of its trouble,† or whether this market—the only aid asked from the Government—may still continue at the expense of a few dollars more per year.

---

* In many cases justice (?) seems to have been meted more in accordance with the requirements of the income of our representatives than with those of abstract right, and it has happened that the case of an arbitrary, cruel captain against some unfortunately weak and impecunious sailor has been decided on the time-honored (among barbarians) maxims that "might makes right," and "the king can do no wrong."

† The London Mercantile Gazette, of October 22, 1852, said: "The number of American ships engaged in the Southern whale-fishery alone would of themselves be nearly sufficient to man any ordinary fleet of ships-of-war which that country might require to send to sea." Instances are not wanting, indeed, where whalemen have undertaken yeoman's service for their country. Thus, in November, 1846, Captain Simmons, of the Magnolia, and Capt. John S. Barker, of the Edward, both of New Bedford, hearing that the garrison at San José, Lower California, was in imminent danger, landed their crews and marched to its relief. Nor were their good services toward foreign governments in peace less honorable to the country than in war, for when the government buildings at Honolulu were burning some years ago, and entire and disastrous destruction threatened, American whalemen rushed to the rescue and quenched the flames already beyond the control of the natives. During the rebellion, of 5,956 naval officers, Massachusetts furnished 1,226, Maine 449, Connecticut 264, New Hampshire 175, Rhode Island 102, and Vermont 81.

F.—THE DANGERS OF THE WHALE-FISHERY.

Notwithstanding the many perils encountered in this pursuit, perils arising from the necessary exploration of new fields to replenish the supply which constantly fails in the old, perils arising from the nature of the cruising-grounds themselves which include the stormiest, most labyrinthine, and most treacherous of seas, and those most subject to typhoons, perils arising too from the very nature of their calling to the men themselves, the casualties are no more at least than fall to the lot of those who follow the sea in other pursuits. Shipwrecks there are, dreary boat-voyages for hundreds of miles, with the terrible accompaniments of death from hunger and thirst, and men fall victims to the strength and ferocity of the gigantic object of their pursuit. Ships sail from port and are never heard of more, or if heard of, it is the casual report of some passing vessel, ships to which the beautiful language of Irving is most appropriate, that have too truly "gone down amidst the roar of the tempest; their bones lie whitening among the caverns of the deep. Silence, oblivion, like the waves, have closed over them and no one can tell the story of their end." But with a greater risk there seems to be no greater mortality than may be found in the lists of the merchant service.

No nobler class of men, no more skillful navigators, ever trod any deck than those who have shipped upon our whalemen. Those in command are brave and daring without recklessness, quick to act in an emergency, but prudently guarding the lives of their men and the safety of their ship; self-reliant but self-possessed.* Every ship is fully manned, and discipline is intended to be fully enforced; hence when immediate action is required by the exigencies of the storm or other threatening circumstances, there is no lack of ready hands to execute any order which may issue from those in authority.†

It is appropriate, however, in a work of this nature, to notice some of the many incidents and accidents which have occurred, and of which an account has been transmitted.

Classifying these somewhat chronologically, one of the earliest re-

* "The highest testimony to the seamanship of our whalemen is that the rate of insurance on the American is just one-half of that on the British vessels engaged in the service."—(Nimrod of the Sea, p. 56.)

† Says the New York Journal of Commerce, in August, 1857: "There lives in affluence at Nantucket, in the eightieth year of his age, and in full possession of a sound intellect, and the enjoyment of all the respect and affection which a well-spent life commands, a retired whaling captain, the keel of whose ship never touched the bottom—who was never at sea a day without going aloft except in a gale of wind—who never lost a man by abandonment or otherwise, or had one off duty more than a week by sickness—who never lost but one spar, though distinguished for many short passages—who never returned from a voyage without a full cargo of sperm-oil. He had sixteen apprentices, mostly uneducated boys from the lower walks of life, whom he instructed and trained to his own calling, and every one of these he has lived to see in respectable standing, and several of them holding high rank as shipmasters."

corded accidents (not previously mentioned in this work) was the one which befel the ship Union, of Nantucket, Capt. Edmund Gardner, master, which sailed from Nantucket on the 19th of September, 1807, for Brazil Banks. When twelve days out, running along at the rate of about seven miles an hour, she struck on a sperm whale with sufficient force to break two timbers on the starboard bow.* The pumps were immediately manned, but the water came in through the break so rapidly that it became evident that the certain destruction of the ship was only being briefly postponed, and preparations were made by Captain Gardner, who was a young man and this his first voyage as commander, to leave her. The boats were lowered, and provisions, water, fireworks, books, and nautical instruments, whatever, in fact, they could safely carry, and which would be of use, were stowed away in them. By midnight—only two brief hours after the accident—the water was up between decks, and an immediate departure was inevitable. This was accomplished, though with much difficulty and danger, as a heavy swell was running. The crew, sixteen in number, left the ship in three boats, but the increased risk of separation led them to divide themselves between two boats and abandon the third. The course of the prevailing wind, which was northwest, and the lateness of the season, made it imperative upon them to steer, not for Newfoundland, which was perhaps the nearest, but for one of the Azores, which was the most easily accessible land.

On the morning of the 2d of October the men rigged sails for the boats, and thus not only progressed with greater speed, but relieved themselves of the fatigue of rowing. During the nights of the 2d and 3d the wind blew a gale, and during a portion of the time they were compelled to lash the boats together and let them drift. By the 4th of October they were obliged to allowance themselves to three quarts of water and sixteen cakes for the whole company for twenty-four hours.

* Quite a number of similar instances are upon record. Marco Paulo mentions, as long ago as 1298, that many of the Chinese junks have as many as thirteen compartments in the hold "to guard against accidents which may cause the vessel to leak, such as striking a rock, or being attacked by a whale. This last circumstance is not unusual; for during the night the motion of the ship through the waves raises a foam that invites the hungry animal, which, hoping to find food, rushes violently against the hull, and often forces out a part of the bottom." Sir William Monson also says the same kind of accident happened to the ship in which he was taken prisoner off the Burlings in 1791, a week before his capture, "the ship giving stem to a whale that lay asleep on her back above the water. The accident was so strange and rare that it amazed the company, who gave a sudden shriek, thinking the ship had foundered upon a rock; but looking overboard they beheld the sea all bloody, which comforted them, conceiving it to be, as they found it was, a stem upon a whale." He also mentions the foundering of a ship from the same cause. Winthrop (ii, p. 7) says, "One of the ships, which came this summer (1640), struck upon a whale with a full gale, which put the ship a stays; the whale struck the ship on her bow, with her tail a little above water, & brake the planks and six timbers and a beam, and staved two hogsheads of vinegar." In March, 1796, the ship Harmony, of Rochester, Capt. George Blankenship, ran upon a whale off the coast of Brazil, and was stove and sunk. The crew were saved, but

When at length they landed, on the morning of October 9, on the island of Flores, their stock of water was already exhausted. They had been at sea seven days and eight nights, and in that time had rowed and sailed nearly 600 miles.*

The accidents resulting from belligerent whales are numerous and well authenticated. At times it has happened that in their rage they have attacked even ships, apparently treating the boats as beneath their notice. Two of the most remarkable instances of this kind are the attacking and sinking of the ships Essex, of Nantucket, and Ann Alexander, of New Bedford.

The former ship, under the command of Capt. George Pollard, jr., sailed from Nantucket on the 12th of August, 1819, for the Pacific Ocean. Nothing out of the ordinary course of events occurred until the 20th of November, 1819. On the morning of that day, the ship being in latitude 0° 40′ south, longitude 119° west, whales were discovered, and all three boats were lowered in pursuit, the ship being brought to the wind and lying with her maintop sail hove aback waiting the issue of the contest. The mate's boat soon struck a whale, but a blow of his tail opening a bad hole in the boat, they were obliged to cut from him, and devote their entire attention to keeping afloat. By stuffing jackets into the hole, and keeping one man constantly bailing, they were enabled to check the flow of the water and reach the ship in safety. In the mean time the captain's and second mate's boats had fastened to another whale, and the mate, heading the ship for them, set about overhauling his boat preparatory to lowering again. While doing this he

the vessel and cargo were lost. In March, 1855, the British schooner Waterloo was attacked and sunk by a whale in the North Sea. In 1859 the ship Herald of the Morning arrived at Hampton Roads leaking badly, having been struck by a large sperm-whale off Cape Horn. She was found to have started seven feet of her stem as far as the wood ends, and to have carried away both bobstays. The whale spouted a large quantity of blood. In 1865 the British schooner Forest Oak, on her passage from Boston to Yarmouth, N. S., struck a whale with such force as to nearly knock her foremast out. She was going at the time at the rate of seven knots an hour. In 1873 the three-masted schooner Watauga, of Washington, N. C., was wrecked on a reef off one of the West Indies. She was originally a side-wheel steamer, and was of 200 tons register. "While running along with a fine six or seven knot breeze, a sudden and heavy shock and jar was felt, and all supposed that the vessel had scudded into a sea with violence. The next moment a pair of whales were seen close alongside to leeward. One of them seemed frisky enough, and made off rapidly, but the other seemed loggy, moved with apparent difficulty, and presently disclosed a huge gash in his side, from which the blood was issuing and coloring the sea about him. The Watauga passed on, and soon lost sight of the whale, when it was discovered that the false stem was torn off, her main stem split, and the wood ends started. The bobstay had, of course, parted, and the bowsprit was adrift. * * * She was with difficulty kept free until she had made Point Peter, where temporary repairs were made to enable her to reach home. Upon her arrival at Washington she was repaired, and the damage found to exceed $700."—(Preble's Notes on Whales and Whaling.) In 1860 the steamer Eastern City, *en route* for St. John, ran into a humpback whale 60 feet long, displacing her cutwater.

* Macy, pp. 237 to 242.

observed a large sperm-whale* break water about twenty rods from the ship. After lying there a few moments he disappeared, but immediately came up again about a ship's length off, and made directly for the vessel, going at a velocity of about three miles an hour, and the Essex advancing at about the same rate of speed. Scarcely had the mate ordered the boy at the helm to put it hard up, when the whale with a greatly accelerated speed struck the ship with his head just forward of the fore-chains. "The ship," says the mate, from whose account this is condensed, "brought up as suddenly and violently as if she had struck a rock, and trembled for a few seconds like a leaf." The whale passed under the vessel, scraping her keel as he went, came up on the leeward side of her, and lay on the surface of the water, apparently stunned, for about a moment; he then started suddenly off to leeward. Mr. Chase immediately had the pumps rigged and set going. At this time the vessel was beginning to settle at the head, and the whale, about 100 yards off, was thrashing the water violently with his tail, and opening and closing his jaws with great fury. Signals had been set for the return of the other boats, for the ship had already settled quite rapidly, and Mr. Chase had given her up as lost. "I, however," writes he, "ordered the pumps to be kept constantly going, and endeavored to collect my thoughts for the occasion. I turned to the boats, two of which we then had with the ship, with an intention of clearing them away, and getting all things ready to embark in them, if there should be no other resource left; and while my attention was thus engaged for a moment, I was aroused with the cry of a man at the hatchway, 'Here he is—he is making for us again.' I turned around and saw him about 100 rods directly ahead of us, coming down apparently with twice his ordinary speed, and to me at that moment it appeared with tenfold fury and vengeance in his aspect." A line of foam about a rod in width, made with his tail, which he continually thrashed from side to side, marked his oncoming. Mr. Chase hoped, by putting the helm hard up, the vessel might cross the line of the whale's approach, and the second shock be avoided, and instantly gave orders to that effect; but scarcely had the course of the ship, already somewhat waterlogged probably, been changed a single point, when the head of the whale crashed into her bows, staving them completely in directly under the cat-head. The speed of the whale at this time was about six miles an hour, the Essex moving at about one-half of that rate. After the second assault the whale passed under the ship as before, and out of sight to the leeward.

Whatever was to be done now, must be done with the utmost dispatch. They were in mid ocean, more than a thousand miles from the nearest land, their ship rapidly settling beneath them, and nothing to save them but frail open boats, each of which must of necessity be heavily loaded. The lashings of the spare boat were cut, and she was

*In the account given by the mate, Mr. Owen Chase, the length of this whale is estimated at about 85 feet, (p. 26.)

carried from the quarter-deck to the waist; two quadrants, two practical navigators, and the captain's and mate's trunks had been hurriedly secured from below by the steward; and the mate had saved the two binnacle compasses. Then, as the ship fell over on her beam-ends, the boat, into which these articles had been placed, was launched. Not more than ten minutes had elapsed since the whale had first attacked the ship, and now she lay full of water, her deck scarcely above the surface of the waves, and her crew abroad on the ocean. As the captain and second mate came up in their boats, their amazement and horror on seeing the condition of their late home cannot be described. By order of Captain Pollard the masts were cut away and the decks were scuttled, and about 600 pounds of bread, some 200 gallons of water, a musket, a small canister of powder, two files, two rasps, two pounds of boat nails, and some turtle were secured. Each boat was fitted with two masts, and a flying-jib and two sprit-sails constructed for each out of the lighter canvas of the ship. The boats were also strengthened and built up about 6 inches above the gunwales as an additional measure for safety. These preparations occupied the larger portion of three days. The ship was now rapidly breaking up, and the captain called a council of the officers to determine what should be done. By an observation taken at noon on the 22d of November they found they were in latitude 0° 13′ north, longitude 120° west. The nearest land was the Marquesas Islands, next to them the Society Islands, but at this time the Pacific was but little explored, and these islands were presumably inhabited by savages than whom the very elements were more kind and hospitable. The final conclusion then was to make for the coast of Chili or Peru. The men were accordingly apportioned among the boats; the mate's boat being the weakest, having been stove several times and being old and patched, was assigned six, while the other two carried seven each. The record of the passage is full of melancholy interest, but too long for insertion here. It tells at length how, in spite of the utmost care, a portion of their miserable pittance of bread was damaged by the breaking of heavy seas into their boats; how their boats were damaged and leaking by the repeated blows of the water; how in the night of November the 28th Captain Pollard's boat was attacked by some kind of a fish and nearly wrecked; how thirst, consuming, raving thirst began its terrible assault; how on the 20th of December they landed on Ducie's Island;* how, unable to find subsistence there, they again set sail, after leaving three of their number, by their own desire, on the island, and commenced, on the 27th of December, to make the perilous voyage toward the island of Juan Fernandez, distant 2,500 miles. The sad recital tells us that on the 10th of January the second mate, Matthew P. Joy, died and was buried at sea, if indeed the simple launching of his body into the deep by his feeble, saddened companions could be called a burial; that on the night of the 12th of January the

* Latitude 24° 40′ south, longitude 124° 40′ west.

boats became separated; that one and then another of the mate's crew became enfeebled and died; that the body of the second unfortunate was dismembered, the flesh cut from his bones, and served out like that of an animal to his starving, raving comrades; that when the darkness of despair had settled upon their clouded, tottering minds the welcome cry of "A sail" was given, and the poor wrecks of humanity still surviving in the mate's boat were picked up, on the 17th of February, by the English brig Indian, Capt. William Crozier, and treated with a brotherly tenderness and humanity.

The captain's and late second mate's boats kept together until the night of the 29th of January, 1820; during the interval between the separation from the mate and this time four men had died out of the two boats, and their bodies furnished their comrades with their only food. The captain's crew became at last reduced to the alternative of drawing lots to see which should be killed to furnish sustenance to the survivors. On the 23d of February, three months from the time when they left their shattered ship, Captain Pollard and Charles Ramsdale, the sole survivors of the boat's crew, were picked up by the ship Daughin, of Nantucket, Capt. Zimri Coffin. The third boat was never heard from. The three men left on Ducie's Island were afterward rescued. The number surviving in the mate's boat was three.*

The fate of the Ann Alexander, Capt. John S. Deblois, which belonged to and sailed from New Bedford June 1, 1850, was not less sudden than that of the Essex, and had her crew been as far from helping hands as was that of the latter ship, not even so favorable a record as the melancholy one of Captain Pollard and his men would have been left of them, and the Ann Alexander would have been set down as one of those missing ships the fate of which will be forever unknown.

On the 20th of August Captain Deblois, having reached that whaling locality known as the "Off-shore Ground,"† discovered whales at about 9 o'clock in the morning. The boats were immediately lowered, and by noon the mate's boat was fast to one. The whale ran a short distance, and then turning rushed at the boat, seized it in his jaws, and in an instant had smashed it to fragments no larger than a common chair. Captain Deblois immediately hastened to the rescue, and took the mate's crew into his boat, which, this being done, contained eighteen men. In the mean time, the disaster having been observed from the ship, the waist-boat was dispatched to assist. When she arrived the crews were divided, the mate taking command of the waist and the captain continuing with his own (or the starboard) boat, and the attack was recom-

*Captain Pollard never cared to allude to the terrible privations and sufferings undergone on this occasion, and would always avoid reference to it if possible. His next voyage was as captain of the ship Two Brothers, which was lost on a coral reef in the Pacific while under his command. For many years Captain Pollard was on the night police in Nantucket, having abandoned the sea. He was employed as a deck hand on board Fulton's first steamboat on the Hudson, on some of its earliest trips.

†Latitude 5° 50′ south, longitude 102° west.

menced, the mate's boat being in the advance. No sooner had the whale perceived this demonstration than he again turned upon the mate, and before anything could be done to avoid the assault the second boat had shared the fate of the first. Again Captain Deblois picked up the swimming crew, and ordered his men to pull for the ship. The situation had become exceedingly critical, for the whale still maintained his hostile demonstrations toward the now greatly overloaded boat. They had proceeded but little distance on their return when he was discovered, with jaws widely open, in hot pursuit. Situated as they were, six or seven miles from their ship, with an enraged whale in pursuit, and no rescuing boat at hand, destruction seemed inevitable, but, to their surprise and joy, the monster passed without harming them, and they soon regained their vessel. Again on board, a spare boat was sent to pick up the oars of the demolished ones, and on her return the attack was renewed upon the cetacean from the ship. As she passed him a lance was thrown into his head. This but served to still more infuriate him, and he again resumed the offensive, making for the ship. As he came near, the vessel was hauled on the wind, and the whale allowed to go past, after which Captain Deblois again advanced his ship to the attack, but when within about fifty rods of the whale it was discovered that he had settled some distance below the surface of the water. It being about sundown, the attack, so far as the sailors were concerned, was given up. Not so, however, with the whale.

Captain Deblois had been standing on the knight-heads, iron in hand, ready to strike when the ship had got near enough, the vessel moving through the water at the rate of five knots per hour. Before time enough had elapsed for him to change his position he discovered the monster rushing toward the ship at a speed of fifteen knots, and in an instant he struck her a terrible blow about two feet from the keel and just abreast of the foremast, shaking her with as much violence as though she had struck a rock, and breaking a large hole through her bottom, through which the water poured in a rushing stream. As soon as the extent of the damage was discovered by Captain Deblois, he ordered the anchors cut away and the cables got overboard, that the ship might be lightened as much as possible. One anchor and cable was cleared, but the other chain, being made fast around the foremast, was not cast off. He also hastily secured his chronometer, sextant, and charts, though the water had invaded the cabin to a depth of three feet. The boats were cleared away, and such articles of necessity as it was possible to get were put into them. The captain made another, but ineffectual, attempt to get into the cabin, and then ordered the boats to shove off, he being the last man to leave the ship, which was already on her beam-ends, with her topgallant yards under water, and being obliged to throw himself into the water and swim to the nearest boat.

When clear of the vessel, and beyond the influence that her sudden sinking would have on the surrounding water, an examination was made

of their stores, which were found to consist of but three gallons of water, not a mouthful of provisions of any kind having been saved! Their boats each contained eleven men, and such was the condition of them that it required unremitting bailing to keep them afloat.

The next morning at daylight, the vessel being still above water, the captain, who alone dared venture on board, succeeded in cutting away her masts with a hatchet. This being done, she righted. The crew then went on board, and, with the aid of their whale-spades, cut away the cable which still hung around the foremast, and when that went overboard the ship sat nearly upright. Holes were now cut in the decks, in the hope of saving some provisions, but all that could be got was five gallons of vinegar and twenty pounds of bread.

It must have been with indescribably heavy hearts that these wrecked mariners set off from the so lately gallant ship that had been for many months their home, and to which they must have become attached, as every true sailor does to his vessel. On the wide waste of waters, in boats which, at their best, are but frail shells, but which now were in poor condition, and leaking, with but twelve quarts of water, and *not one full day's stock of food*, their situation was, indeed, appalling. The terrible alternative was forced upon them, that unless a speedy rescue could be effected, the time was near at hand when the life of one or more of their number must be sacrificed that the others might survive. With what horror must they have recalled the terrible tale of the loss of the Essex, and remembered how, one by one, her crew wasted away and died, or how, when the fearful lottery of death was drawn, a miserable wreck of a man, a merely animate mass of skin and bones, yielded up his life to prolong that of his comrades!

Happily their story was to be no further the counterpart of that of Captain Pollard and his men. Steering northerly, hoping to reach a rainy latitude, and thereby prolong with water that life which they had no food to sustain, on the 22d of August they sighted a sail, signalled it, and to their indescribable joy were seen, and soon they trod the deck of the ship Nantucket, of Nantucket, Capt. Richard C. Gibbs.*

* The Honolulu Friend, dated May 6, 1854, reports that about five months after this disaster, this pugnacious whale was taken by the Rebecca Simms, of New Bedford. Two of the Ann Alexander's harpoons were found in him, and his head had sustained serious injuries, pieces of the ships's timbers being embedded in it. Disease had robbed him of his propensity to resist attack or of any further "carrying of the war into Africa." He yielded to his captors from 70 to 80 barrels of oil. Among other cases of the attack by whales upon a ship may be mentioned one where the Pocahontas of Holmes's Hole was assailed. Two boats had been lowerd, and one had fastened to a whale. In attempting to lance the whale, he turned upon the boat and crushed it to atoms. The other boat picked up the crew and returned to the vessel, which was run down toward the victor in the previous contest. When within two boat's length, the whale turned upon the ship, striking her bow with such violence as to start one or two planks and break one or two timbers on the starboard side. The Pocahontas was obliged to put into Rio Janeiro, leaking 250 strokes per hour. The merchant-ship Cuban, of and for Greenock, from Demerara, in 1857 was attacked by a whale, which struck her with such force as to completely stop

How many instances of the destruction of ships by whales the catalogue of "missing" vessels may furnish can never be known, but it may be safely presumed that some of those ships from which widows, fatherless children, and sorrowing relatives have sought for some tidings or some memento in vain, would help to swell the list. A few brief days, and had not the crew of the Ann Alexander so providentially met a rescuer, their doom must have been sealed, and their vessel would have appeared on the marine lists simply as a "missing" ship. The landsman would glance casually at the expression, and think no more of it. The mariner and the relatives and friends of those who followed the sea would read the word with a shudder as they thought of the probable sufferings, privations, and possibly horrible, lingering death the unfortunate crew might have encountered. Those to whom the word meant far more than an empty sound would think—"What sighs have been wafted after that ship! What prayers have been offered up at the deserted fireside of home! How often has the mistress, the wife, the mother pored over the daily news, to catch some casual intelligence of this rover of the deep! How has expectation darkened into anxiety,—anxiety into dread,—and dread into despair! Alas, not one memento remains for love to cherish. All that shall ever be known is, that she sailed from her port and was never heard of more."

But the pugnacity of the whale is rarely directed against the ships themselves, so rarely that when the account of the loss of the Essex reached England, some of the prominent British journals scouted the tale as preposterous. Scarcely a whaleman, however, but can tell some story of the attacking of boats by these monsters, and the attacks and parryings require on the part of those having charge of the boats the utmost nerve, adroitness and precision. A few instances of this kind it may be well to briefly mention.

In October, 1832, the ship Hector, of New Bedford, Capt. John O. Morse, then ninety days from port, "raised" a whale, and lowered for him. But while the crews were proposing offensive operations, the whale himself took the initiative, and just as the harpoon struck him he struck the mate's boat, staving it badly. By drawing sails under her and bailing, the boat was kept afloat, and the attack resumed. In the mean time Captain Morse came to his assistance, and the mate warned him of the character of his antagonist, but Captain Morse told him he had a long lance and he wanted to try it. Accordingly the Captain advanced to the whale, which immediately turned, and, taking the Cap-

her headway. As she was a ship of 500 tons, deeply laden, and running at the rate of nearly ten knots an hour, some idea can be gained of the tremendous momentum of her assailant.—(Ricketson's Hist. of New Bedford, p. 101.) The London Punch of December 6, 1851, contained a humorous description of the attack on the Ann Alexander. A similar, though not so disastrous an experience befel the Pocahontas, of Holmes's Hole, in 1850. She was attacked by a large bull sperm whale, and put into Rio Janeiro for repairs, leaking 250 strokes per hour.

tain's boat in his mouth,* held it on end and shook it in pieces in a moment. Not satisfied with this he chewed up the boat-kegs and whatever appurtenances to, or pieces of the boat came in his way. The mate now offered to pick a crew and boat, and renew the fight, to which suggestion the captain assented, and with the best and most experienced men of the crew, Mr. Norton again essayed to capture the wrecker of boats. As the mate's boat again approached, the whale again assumed the offensive, and the order was given to "stern all" for their lives. For half a mile or more the chase was continued, the crew striving, as only men in a desperate situation can strive, to keep clear of the enraged whale, which followed them so closely as several times to bring his jaws together within 6 or 8 inches of the head of the boat. By watching his chance, as the monster became exhausted and turned to spout, Mr. Norton succeeded in burying his lance in the whale's vitals, killing him almost instantly.

On cutting him in, two irons were found belonging to the ship Barclay, and it was afterward ascertained that about three months before the first mate of the Barclay had lost his life in an encounter with him. He made ninety barrels of oil. Mr. (afterward captain) Norton mentioned this as the first instance within his knowledge where a whale attacked a boat before being struck.

In 1850, Captain Cook, of the bark Parker Cook, of Provincetown, lowered two boats for a bull sperm whale. The nearest boat met him

---

* In attacking a boat the sperm whale will sometimes turn upon his back, resuming his natural position to breathe.

In 1859, Captain Pierce, of the Emerald of New Bedford, wrote home that he had had an encounter with a "digger" whale, and after nine hours of hard fighting, had killed and sunk him. They had had three boats stoven, lost five irons and seven bombs, and broken several oars in the melee, and in trying to haul the whale up, both lines had parted, and he had again gone down in forty fathoms of water.

Captain Davis thus describes the whale-boat and its fittings. (See Nimrod of the Sea, p. 157): "It is the fruit of a century's experience, and the sharpened sense and ingenuity of an inventive people, urged by the peril of the chase and the value of the prize. For lightness and form; for carrying capacity as compared with its weight and sea-going qualities; for speed and facility of movement at the word of command; for the placing of the men at the best advantage in the exercise of their power; by the nicest adaptation of the varying length of the oar, to its position in the boat; and lastly, for a simplicity of construction, which renders repairs practicable on board the ship, the whale-boat is simply as perfect as the combined skill of the million men who have risked life and limb in service could make it. This paragon of a boat is 28 feet long, sharp, and clean cut as a dolphin, bow and stern swelling amidships to 6 feet, with a bottom round and buoyant. The gunwale amidships, 22 inches above the keel, rises with an accelerated curve to 37 inches at each end, and this rise of bow and stern, with the clipper-like upper form, gives it a duck-like capacity to top the oncoming waves, so that it will dryly ride where ordinary boats would fill. The gunwales and keel, of the best timber, are her heaviest parts, and gives stiffness to the whole; the timbers, sprung to shape, are a half-inch or three-quarters in depth, and the planking is half-inch white cedar. Her thwarts are inch pine, supported by knees of greater strength than the other timbers. The bow-oar thwart is pierced by a 3-inch hole for the mast, and is double-kneed. Through the cuddy-board projects a silk-hat-shaped

head on, and, when abreast of the hump, the boat-steerer put two irons into him. Before the boat could be brought head on, the whale broached half out of water and capsized her, the line fouling the boat-steerer's leg, almost severing it from the body. With great presence of mind he cut the line, and the other boat picked up the upset crew, and returned to the bark. But the whale was not satisfied with his victory over the boat. Like his fellow-destroyers of the Essex and Ann Alexander, he aimed at a larger prey. Making for the bark, he struck her a tremendous blow, prostrating the men on deck and burying the cutwater and stern up to the planking in his head. A second time he struck the vessel, but with much less force. In the mean time Captain Cook got his bomb-lance ready and lowered another boat. Three times, within eight yards of him, the captain fired the lance into his body, and eventually made him spout blood, though with every piercing of the lance he rushed open-mouthed at the boat, requiring the utmost skill and coolness to avoid him. One hundred and three barrels of oil was

---

loggerhead, for subbing and managing the running line; the stem of the boat is deeply grooved on top, the bottom of the groove being bushed with a block of lead, or sometimes a bronze roller, and over this the line passes from the boat. Four feet of the length of the bow is covered in by a depressed box, in which the spear-line, attached to harpoons, lies in carefully adjusted coils. Immediately back of the box is a thick pine plank, in which the "clumsy cleet," or knee-brace, is cut. The gunwale is pierced at proper distances for thole-pins, of wood, and all sound of the working oars is muffled by well-thrummed mats, kept carefully greased, so that we can steal on our prey silent as the cavalry of the poor badgered Lear. The planking is carefully smoothed with sand-paper, and painted. Here we have a boat which two men may lift, and which will make ten miles an hour in dead chase by the oars alone.

"The equipment of the boat consists of a line-tub, in which are coiled 300 fathoms of hemp line, with every possible precaution against kinking in the outrun; a mast and sprit-sail; five oars; the harpoon and after-oar, 14 feet; the tub and bow-oar, 16 feet; and the midship, 18 feet long; so placed that the two shortest and one longest pull against the two 16 feet oars, which arrangement preserves the balance in the encounter, when the boat is worked by four oars, the harpoon-oar being apeak. The boat is steered by an oar 22 feet long, which works through a grummet on the stern-post. The gear of the boat consists of two live harpoons, or those in use, and two or three spare irons, *i. e.*, harpoons secured to the side of the boat above the thwarts, and two or three lances, secured by cords in like position, the sharp heads of all these being guarded by well-fitted, soft wood sheaths. The harpoon is a barbed, triangular iron, very sharp on the edges, or it is a long, narrow piece of iron, sharpened only on one end, and affixed on the shank by a rivet, so placed that before use the cutting edge is on a line with the shank, but after penetrating the whale, and on being drawn back, the movable piece drops at right angles to the shank, and forms a square *toggle* about six inches across the narrow wound caused by its entrance. The porpoise iron is preferred among the Arctic whalemen, as, owing to the softness of their blubber, the fluked iron is apt to cut its way out. The upper end of a shank, 30 inches long, terminates in a socket, into which a heavy oak or hickory sapling pole 6 feet long is introduced. A short piece of whale-line with an eye-splice at one end is then wrapped twice around the shank below the socket and close spliced. This line is stretched with great strain, and secured to the pole with a slight seizing of rope-yarn, intended to pay away and loose the pole in a long fight. The tub-line is secured to the eye of the short line, after the boat is lowered. The lance is simply an oval-headed instrument, with a cutting edge, a shank 5 or 6 feet long, and a handle as long,

the reward of the captors, who were obliged to put into Fayal for medical advice for the boat-steerer, and to repair their damaged vessel.*

Captain Davis, in his "Nimrod of the Sea,"† mentions two instances of fighting whales. The first was encountered by Captain Huntting, off the river De la Plata, and was, as is usually the case with these aquatic warriors, a bull sperm. "When the monster was struck," says Captain Davis, "he did not attempt to escape, but turned at once on the boat with his jaw, cut her in two, and continued thrashing the wreck until it was completely broken up. One of the loose boats picked up the swimmers and took them to the ship; the other two boats went on, and each planted two irons in the irate animal. This aroused him, and he turned his full fury on them, crushing in their bottoms with the jaw, and not leaving them while a promising mouthful held together. Twelve demoralized men were in the water, anxious observers of his majestic anger. Two men who could not swim had, in their terror, climbed on his back, and seated themselves astride forward of the hump, as perhaps the safest place from that terrible ivory-mounted war-club which he had brandished with such awful effect. At one time another man was clinging to the hump with his hands. The boat which had gone to the ship with the crew of the first stove boat now returned and took the swimmers on board.

The whale had now six harpoons in him, and to these were attached three tow-lines of 300 fathoms each. He manifested no disposition to escape, but sought to reduce still further the wreck about him. Boats, masts, and sails were entangled in his teeth; and if an oar or anything touched him, he struck madly at it with his jaw. This was entirely satisfactory to Captain Huntting, who was preparing other boats to renew the fight. At length two spare boats were rigged, and these, with the saved boat, put off again. The captain pulled on, but the whale saw the boat and tried his old trick of sweeping his jaw through the bottom of it. She was thrown out of his sweep, however, and the captain fired a bomb-lance, charged with six ounces of powder, which entered behind the fin and exploded in his vitals. Before the crew could get out of his way "he tore right through my boat like a hurricane, scattering all

with a light warp to recover it. A hatchet and a sharp knife are placed in the bow-box, convenient for cutting the line, and a water-keg, fire apparatus, candles, lantern, compass, and bandages for wounds, with waif-flags on poles, a fluke-spade, a boat-hook, and a "drug," or dragging float, complete the equipment of a whale-boat. Among this crowd of dangerous lines and threatening cutting gear are six pair of legs, belonging to six skilled boatmen. Such a whale-boat is ours, as she floats two miles from the ship, each man in the crew watching under the blade of his peaked oar for the rising whale, and the captain and boat-steerer standing on the highest point, carefully sweeping the horizon with trained eye, to catch the first spout, and secure the chance of 'getting on.'"

*Luckily the whale struck the Parker Cook directly on the stem. Had the blow been delivered on almost any other part of her hull, she undoubtedly would have shared the fate of the Essex and Ann Alexander.

†Pages 357–'8–'9, 385–'6–'7.

hands right and left." So said Captain Huntting. Now four boats were utterly lost, some twelve hundred fathoms of line, and all the gear. The remaining two boats were hastily and poorly provided, the men were gallied,* the sun was going down, and the captain, when he was fished out, consented to give up the day and cry beat.

All hands went to work to fit other boats. Through the night, under shortened sail, the ship lay near the scene of conflict, and while the weather was calm it was possible to keep track of the whale as he occasionally beat around. But the breaking day brought rough weather, and the captain proceeded to Buenos Ayres, as much to allow his men, who were mostly green, to run away, as for the purpose of refitting, as he knew they would be useless thereafter. In this design he was not thwarted. Most of them promptly deserted, having had enough of wrestling with "the fighting whale of the La Plata."

The second instance mentioned by Captain Davis, is the more rare case of vicious pugnacity in the right whale. The name of the captain who was the chief actor in the scenes is not given, but after premising that he is not an old man, and his residence is upon Long Island, he plunges directly into the narration thus, using the language of his informant: "My second mate had fastened to a large whale that seemed disposed to be ugly; so I pulled up and fastened to her also. I went into the bow and darted my lance, but the whale rolled so that I missed the life and struck into the shoulder-blade. It pierced so deep into the bone (perhaps through it) that I could not draw it out; the whole body of the whale shivered and squirmed as though in great pain. Then, turning a little, she cut her flukes, taking the boat amidships.† The broadside was stove in, and the boat rolled over, the crew having jumped into the sea. I cut the line in the chocks at the same moment, to save being run under with a kink. The crew were soon safely housed on the bottom of the upturned boat, or swimming and clinging to the keel. The second mate wanted to cut his line and pick us up, but I foolishly told him to hold on and kill the whale; that we were doing quite as well as could be expected. But I had bragged too soon. Just then the whale came up on the full breach, and striking the boat, he went right through it, knocking men and wreck high in the air. Next the great bulk fell over sideways, like a small avalanche, right in our midst; and spitefully cut the corners of her flukes right and left. In the surge and confusion two

* That is, frightened.

† The tail is the chief weapon of the right whale, offensively and defensively, and such is the ability with which it can wield this terrific weapon that it can sweep an arc from eye to eye clear of its foes. The sperm whale, on the contrary, relies mainly on its jaw. In the attack on these monsters, then, the tactics must be varied to avoid more particularly the flukes of the right and the equally formidable lower jaw of the spermaceti whale. Not that the opposite extremes of these brutes are by any means harmless, but they are secondary to these chief agents. When it is possible to haul alongside the running whale, the officer of the boat will sometimes with his fluke-spade succeed in "hamstringing" the brute by severing the tendons at the "small."

poor fellows went down; we saw no sign of them afterward, and the water was so dark, stained with blood, that we could not see into it.

"As the whale came feeling around with her nose, she passed close by me. I was afraid of the flukes, and got hold of the warp, or iron pole, or her small, or something, and towed a little way till she slacked speed a little. Then I dove under, so as to clear the flukes, and came up astern of them. I was in good time; for having felt the boat she turned over and threshed the spot with a number of blows in quick succession, pounding the wreck into splinters. She must have caught sight of me, for she came up on a half breach, and dropped her head on me, and drove me, half stunned, deep under water. Again I came up near the small, and again dove under the flukes. From this time she seemed to keep me in sight. Again and again—the mate told me afterward—she would run her head in the air and fall on my back, bruising and half drowning me as I was driven down in the water.

"Sometimes I caught hold of the line, or something attached to the mad brute, and would hold until a sweep of the flukes would take my long legs and break my hold. The second mate's boat had cut long ago, and watched her chance to pick up the surviving crew, but had not been able to reach me; for when the whale's eye caught the boat, she would dash for it so wickedly that the whole crew became demoralized, owing to the loss of the two men, and the sight, to them more terrible than to me perhaps, of the peril the captain was in. To husband my strength, I gave over swimming, and, treading water, I faced the danger, and several times by sinking avoided the blow from her head. As a desperate resource, I strove with my pointed sheath-knife to prick her nose;* I did all a strong man was in duty bound to do to save his life. The cooper, who was ship-keeper, ran down with the ship, intending to cut between the whale and myself, but we were at too close quarters. He was afraid to run me down lest he might tear me with the ragged copper. Thus for three-quarters of an hour that whale and I were fighting; the act of breathing became labored and painful; my head and shoulders were sore from bruises, and my legs had been pounded by his flukes; but it was not until I found myself swimming with my arms

* Says Captain Davis: "Had the right whale the habit of 'jawing back,' as the sperm whale has, it would be next to impossible to secure him by the present weapons and methods of our whalemen. * * * Read Scoresby, Jardin, and Beale, the fathers of whaling literature, and they will not reveal the secret of the weakness of the right whale. Whalemen and naturalists, they have failed to record the important fact, that on the tip of the upper jaw there is a spot of very limited extent, seemingly as sensitive in feeling as the antennæ of an insect; as keenly alive to the prick of lance or harpoon as a gentleman's nose is to the tweak of finger and thumb. However swiftly a right whale may be advancing on the boat, a slight prick on this point will arrest his forward motion at once. I think it safe to say that he will not advance a single yard after the prick is given. He will either pitch his head, and round down, like a great wheel turning on a fixed axis, or he will turn shortly to the right or left, according to the part of the nose which is pricked. Sometimes he will throw his enormous head straight in the air, and settle backward tail first, by this motion exposing his

alone and that my legs were hanging paralyzed, that I felt actually scared. Then it looked as if I couldn't hold out much longer; I had seen the ship close beside me, and the second mate's boat trying to get in to me, and throwing me lines, or something to float on, but I had failed to reach them. Now these things seemed very far off; that was the last I remembered until I came to on board the ship.

"I was afterwards told that the first mate, in answer to a signal from the ship,* had come up, and seeing me feebly paddling with my hands and not answering to his hail, he put straight into the fight. The whale saw them coming and made for them. The men sprang to their oars, and the mate had only time to seize my collar, while they pulled their best to escape from the furious whale. They thus gained time to take me into the boat, seemingly a drowned man. The mate had true pluck. Leaving me to the care of the crew on board, he put back for the whale. As he afterwards said, "She was too dangerous a cuss to run at large in that pasture-field." Watching a chance, he got a "set" on her over the shoulder-blade, and sent the red flag into the air. This tamed her; she lagged around for a time, and settled away dead. The mate then

---

whole throat to the thrust of the harpoon or lance; he may take any course, save the one directly forward. It seems almost as though this sensibility to touch was a guard against the collision of parts so important to existence with other objects, and which are beyond the line of vision. And it is also endowed with a backing power which is simply marvelous, when we consider the enormous weight moving forward with great speed. This very marked peculiarity of the right whale is constantly taken advantage of by the whaleman, who, working about its head completely out of the reach of its active flukes, parries the charge of the enraged monster as deftly as the fencer glances the thrust of his antagonist's sword. If an advancing whale glides under the boat, and the back, or 'small,' touches the keel, then, quick as the lightning flash, the responsive flukes will whip up, and send boat and crew into the air, amidst a perilous tangle of kinking line, sharp harpoons, lances, spades, hatchets, knives, and boat-gear generally. An accursed attribute of such sharp company is to travel point or edge first, and form closer acquaintance than is agreeable." (Nimrod of the Sea, p. 376.)

*Each whale-ship has a private code of signals for her absent boats to signify when to return, where to find whales, &c., so when two ships, not cruising in company, lower for whales, the men on board of one ship can recall the boats, change their course, or convey any other similar intelligence without the nature of the tidings being known to the crew of the rival vessel until it is too late to be available. Captain Preble, in his "Notes on Whales and Whaling" (No. 37), illustrates this fact by giving the following, which was the code used by Capt. Elisha Dexter, of the whaling brig William & Joseph: "Whales ahead—Down jib. Whales astern—Haul up spanker. Whales between the ship and boats—Flag half mast. Whales on the weather bow—Haul up the weather clew of the foresail. Whales on lee bow—Lee clew of foresail. More whales and a better chance—Flags on the fore-top-gallant-mast head and peak of the spanker. Whales on the weather beam—Mizzen topsail aback. Whales on the lee beam—Keep the ship off and luff her up again. Whales too near to keep off—Signal to come on board. This signal is made by standing on the top-gallant yards and holding flags in your hands." Signaling is sometimes done with the mast-head waif, which is a light pole 6 or 8 feet long, with a hoop fastened on the end and covered with canvas. (This is sometimes called a "yonder" by English whalemen.) Scammon, 230.

came on board and reported sunk whale;* and I was put to bed, a mass of bruised flesh. It was several weeks before I was able to take my place in the head of my boat again."†

In the early days of Pacific whaling, not only did our sailors have to seek and encounter their gigantic antagonist amid the dangers of hidden reefs and an unexplored and unknown ocean, but frequently, when putting into some of the numerous islands for supplies, they were compelled to fight the wily and treacherous savages inhabiting some of those groups. Many a vessel had been "cut out," and not a man survived to tell the story of the massacre. How far their brother whalemen had been instrumental in thus bringing upon their heads this vengeance for real or fancied wrongs it is difficult to determine. Beyond a question the natives in some localities, disposed to be peaceable at first, had been enraged by the thoughtless, contemptible, or villainous conduct of some of their white visitors, and upon the heads of the next unguarded comers descended the blow now aimed rather at a race than at any particular set of men. Instances are not wanting of cruel, dastardly, treacherous conduct on the part of sailors towards the inhabitants of these sunny islands, and, smarting under their wrongs, their spirit of revenge made no discriminating divisions between the innocent and the guilty; the only thing cared for was the fact that they were whites.

An instance of this dangerous element in the whaleman's life occurred to the crew of the ship Awashonks, of Falmouth, Prince Coffin master.

---

* Captain Davis says, (p. 238,) "A peculiar feature in right-whaling is the considerable number which sink on being killed. This rarely occurs with the sperm whale. With the hump-back it is the rule, and therefore this fishing is carried on in shallow sounds and bays. On putting the question, 'Why do right whales sink?' scarcely two men will give the same reason in reply. Captain West, when master of the Adeline Gibbs, in conversation with two Arctic whalemen, at Maui, gave the following answer: 'To lance a right whale over the shoulder-blade, directing the lance downward, will kill it in the shortest time; but he will be almost certain to sink. Such a wound will be followed by a rushing escape of air, manifesting itself in large and continuous bubbles rising through the water. When this occurs the whale is certain to sink.' Therefore, he holds to the theory that whales are furnished with a sound, or air bladder, like fish, and that through no other cause than injury to this bladder could the whale settle instantly as it does. The two captains above mentioned stated that on their last cruises one had taken nine whales, without one sinking. The other had sunk eight whales, and prided himself on the fatal thrust of his lance over the shoulder." Capt. S. P. Winegar, of the Julian, expressed himself in 1860 (see N. B. Shipping List) of a decidedly different opinion. He believed it was owing to the whales themselves and not to the manner of killing them. He further states that whales sink more often on some ground than on others, and some kinds on the same ground more than others. The right whale is more liable to sink than the bow-head, and bow-heads sink oftener in the Ochotsk than in the Arctic. He had whaled six seasons in the Arctic and never knew of whales sinking there.

† Different captains have different opinions about the captain's place. Some of the most successful say they can do better by remaining on board the ship and directing the movements of the boats; others equally fortunate prefer to be "where the battle rages" strongest.

On the 5th of October, 1835, the ship touched at Namarik Island * to recruit. The natives came on board the ship, as was usually their custom, but in no extraordinary numbers, and they manifested only the ordinary curiosity common to all these islanders in those days. At noon the captain, mate, and second mate went down to dinner, leaving the third mate, Silas Jones, in charge of the deck. Having finished, they returned, and Mr. (afterward Captain) Jones went below, coming back in about fifteen minutes. The ship's company at this time were scattered about the vessel; three of them were aloft on the lookout for whales, and one watch was below. Just after the return of Mr. Jones to the deck the attack commenced. The natives, who had, unnoticed, grouped themselves, suddenly made a rush for the whale-spades, which were in their accustomed places in the spade-rack under the spare boats. Captain Coffin was the first one to fall, being beheaded with a broad-edged spade, and almost simultaneously the man at the helm was killed. The first mate was butchered as he leaped down the fore hatch, while the second mate, who had run out on the jib-boom, was struck with some missile, and, falling, was clubbed to death by the savages. In the mean time the third mate had seized a spade, and after a struggle secured it. This he threw at a native, but, the wily savage dodging, it fastened firmly into the wood-work. Before Mr. Jones could loosen it, two natives had hold of the pole behind him. Unable to secure it, and the inequality of the conflict becoming each moment greater, Mr. Jones made a run for his life. At this time he was the only white man on deck abaft the try-works, and so closely was he beset that he was unable to escape until he reached the fore hatchway, down which he jumped. The deck was now in the possession of the natives, who proceeded to fasten down the hatches and close the companion-way so as to imprison the crew. The leader then took the wheel and headed the ship for the shore. The men who were aloft and were the horrified spectators of this butchery, feeling that their only safety lay in thwarting the plans of the savages, went as far down the rigging as they safely could and cut the braces. The yards now swinging freely the ship lost her steerage-way and slowly drifted toward open water.

During this time the third mate and the remaining survivors of the ship's company were by no means idle. Knowing that in the cabin were the ship's muskets, and realizing that it was necessary to secure them before they fell into the hands of the natives, they worked their way aft, and managed to gain possession of them unseen by their foe. From this castle they fired upon the savages wherever a mark was offered, now at the faces as they peered through the skylights, now through the cabin windows at the assembling canoes. But now a new idea occurred to the prisoners. By order of the third mate a keg of powder was got up from the run, a quantity of it was placed on the upper step of the companion-way and a train laid to the cabin. Direct-

* Latitude 5¼° north, longitude 168° east. One of the Marshall group.

ing his men to be ready to rush on deck the instant the explosion had taken place, regardless of him if he was injured by it, he fired the train. The crash of the timbers and the screams and yells of the wounded and terrified savages told of the success of the plot. Rushing on deck the crew speedily drove overboard those natives who had not already found refuge there, and the terrible conflict was over. From first to last the fight occupied about an hour. The captain, mate, and second mate were killed, and four men had received fearful gashes from the murderous spades; one man died a few days afterward, the rest recovered. Mr. Jones took charge of the ship and brought her home.*

One of the most fruitful sources of peril to the whaleman is the danger of his boat being taken down by the whale through the line fouling, or of being taken out of sight from the ship in his desire to hold to his whale to the last moment. Numerous cases have occurred where a boat's crew has been lost under one or the other of these circumstances, and though occasionally in the latter case they may have recovered their own ship, or have been rescued by another, the danger arising from this cause has always been formidable. Occasionally the boat

*This account is gathered from that of the third mate, Captain Silas Jones, of Falmouth (who, with the characteristic modesty of whalemen, refers but little to his own actions in the struggle), and from that given by Captain Davis in the "Nimrod of the Sea." The annals of whaling afford many instances of a similar nature to this, both in the English and American South Sea fishery.

In April, 1825, the ship Oeno, of Nantucket, struck on a reef near Turtle Island, one of the Fejee group, and speedily showed signs of breaking up. The crew, twenty-one in number, took to the boats and landed upon the island, lured thither by the friendly motions of the natives, but when ashore about two weeks a tribe from a larger island visited the one upon which they were, and finding them unarmed massacred all but one of them. He escaped by hiding until they returned to their own island, and subsequently got away from the island.

In 1834, or '5, the brig Waverly, Capt. William Cathcart, of Woahoo, was cut off at Strong's Island and all on board massacred, and in 1842 the English whaler Harriet, of London, Capt. Charles Bunker, shared the same fate.

In 1842 or '3, seventeen of the crew of the whale-ship Offly, of London, were massacred by the natives of Solomon Islands, in revenge for the murder of a thief by the mate of another vessel.

In 1845 the captain, second mate, and two boats' crews of the French whaler Angeline were reported massacred at the Mulgrave Islands.

In 1847 the ship Triton, of New Bedford, put into Sydenham's Island (one of the King's Mill group), to recruit. While the captain with his boat's crew were ashore purchasing a fluke-chain, the natives, incited by a renegade Spaniard, attacked and captured the ship, killing one of the mates and several of the crew. The second mate with his men escaped in a boat. The ship worked off shore and the natives left her. She was afterwards carried into Papiete, (one of the Society Islands). The United States and Alabama, both of Nantucket, touched at the King's Mill group and succeeded in rescuing the survivors. In all, five were killed and seven wounded.

In 1852 the brig Inga was cut off at Pleasant Island, and all on board were murdered. One of the original crew, left on the island about a year before to recruit, was spared.

These are only a few of numerous instances. The crews of English ship Syren, the Boy, of Warren, R. I., the Twilight, of New Bedford, and many others suffered at the hands of the natives of the Pacific and Indian Oceans.

gains a rescuing ship or port only after intense suffering on the part of the crew. One of the most notable instances of this kind is recounted in "The Whale and his Captors"* of Captain Hosmer and his boat's crew from the bark Janet of Westport.

While off the coast of Peru, on the 23d of June, 1849, three boats were lowered for a school of sperm whales. Each boat made fast, and Captain Hosmer soon "turned up" his. In putting about to tow him to the ship the boat was capsized, and boat-keg, lantern-keg, boat-bucket, compass, paddles, &c., were lost. She was righted and the oars lashed across her to prevent another overturn, as she was full of water, and the sea continually breaking over her. Signals of distress were set, the other boats being about a mile and a half off. Captain Hosmer saw the other boats take their whales alongside the bark, which was still heading toward his own, but to his amazement, when within about a mile, she stood off on another course and continued so until the coming on of night hid her from the anxious eyes of the horror-stricken crew. They now got up alongside the whale and tried unsuccessfully to free their boat of water. Relinquishing this hope they cut from the whale, and, rigging some pieces of the boat-sail, they steered toward the vessel's light, which at intervals became visible, but in the morning the distance had apparently not lessened. They could behold their shipmates cutting in their whales, but all efforts to attract their attention were unavailing. Again they made a futile attempt to bail the water from their boat. Finding it impossible to make their situation known to their comrades and the distance between them constantly increasing, they put about before the wind. On the second morning the wind, which from the time they lowered had blown freshly, being less strong, they threw overboard their whaling craft and a third time tried to bail their boat, but they lost one of their companions without accomplishing their purpose. Again in the afternoon they essayed, and this time they were successful, but another man was sacrificed in the attempt. For forty-eight hours they had been up to their arms in water, without a morsel of food or a drop of drink, and they were suffering painfully from thirst. Two of the survivors already were delirious. The nearest known land was Cocus Island, on the coast of Peru, a thousand miles away; not a man on board was capable of handling an oar, and their only means of propulsion was a small fragment of sail.

For Cocus Island then it was determined to head, and tearing up the ceiling of the boat they fashioned from it a sort of wooden sail.

Nothing out of the ordinary course of starvation, thirst, and a rapid decline of their energies, occurred until seven days had elapsed, during which time not a morsel of food nor a drop of water had lent them strength, nor a reviving shower fallen to aid in prolonging their existence. It was now agreed to cast the terrible lot to see which of their number should die that the rest might live, and the unfortunate man

*Page 311.

upon whom the choice fell met his fate without a murmur. Toward the close of the day a shower fell.

Being without compass or other instrument to determine their course or situation Captain Hosmer was obliged to steer as best he could with such aid as was afforded by the north star and the rolling swell of the sea from the south. On the eighth day another of their number died from exhaustion, and it was deemed necessary to steer a more northerly course in hopes to again be blessed with rain.

On the ninth day another shower fell, and this blessing was followed by the remarkable circumstance of a dolphin leaping directly into their boat. Several birds also approached so near as to be killed by the wanderers, and great relief was afforded them by these happy events.

On the 13th of July, land was seen, which proved to be Cocus Island (uninhabited),* and this land the shattered remnant of a strong and hardy crew succeeded in reaching. They succeeded in catching a pig, and, drinking its blood, were reinvigorated. A plentiful supply of birds and fresh water aided their recuperation. On the second day after landing they were overjoyed to see a boat approach, which proved to belong to the Leonidas, Captain Swift, of New Bedford, a brother whaleman, then recruiting in Chatham Bay, and it is needless to say that all that could be done for the survivors was done.†

Revolts among the crew, occasioned sometimes by the brutality of the officers, and fully as often by a spirit of lawlessness in a very small minority of the men, and spreading from them like an infection to their shipmates, are at times met with. Two of the most notable of these, coming entirely within the latter category, are given.

Scarcely had the horrors of the loss of the Essex ceased to appal the minds of the people of Nantucket, when news of another and a more

---

* Latitude 5° 27′ north, longitude 87° 15′ west. Of the crew of six, but two survived.

† In a letter from the mate of the Janet to her owners he says that after his boat returned to the ship, he run down for that of the second mate, the only one then in sight from the ship. They then proceeded in the direction in which the captain's boat was last seen going, and lay to all night with all sail set and lights burning. They cruised three days, but were unable to get any trace of the captain's boat and were forced to the melancholy conclusion that it had been carried down by a foul line, more particularly as he had a new line with him coiled but two days before. (See "The Whale and His Captors.")

In January, 1860, the Massachusetts, of New Bedford, lowered four boats for a school of whales. One was killed and the mate was sent to bring the ship. She was not out of sight and the mate did not succeed in regaining her until 10 o'clock in the evening. The other three boats lay by the whale all night, and the next day, having seen nothing of the vessel, cut from him, and started for Brazil, 330 miles distant, reaching land in five days. Cheever, in "The Whale and His Captors," p. 219, instances another thrilling adventure of this kind.

"Foul lines" have been the death of many a whaleman. A kink in the line, as it runs from the tub, catches an arm, or a leg, and in an instant the unfortunate man is overboard and too often never seen again alive. On page 138 of "The Whale and His Captors" may be found an example of this form of peril.

shocking calamity was brought to the island. The most diabolical, cold-blooded mutiny ever perpetrated upon the deck of any whaleship was that on board the Globe, of Nantucket, in the month of January, 1824, and this it was that thrilled the minds of the islanders and eclipsed the terrible details of the loss of the Essex.

The Globe, Thomas Worth commander, sailed from Nantucket in the latter part of December, 1822, and when she again entered that port in November, 1824, her decks were stained with the life-blood of her captain and her three mates. On the night of January 25, 1824, four of the crew, headed by Samuel B. Comstock, a boat-steerer, mutinied, and killing their superior officers, took the ship into the Mulgrave Islands, intending to destroy her. Arrived there, they proceeded to strip the vessel, and while doing so a quarrel arose among themselves, and it culminated in the death of Comstock. Soon after this, before the work of demolition had further progressed, six of the men, most of whom had taken no part in the mutiny, and simply remained quiet to avoid the fate that had overtaken the captain and mates, having been sent to guard the ship, cut the cable and escaped from the islands, arriving at Valparaiso after a long and boisterous passage. Here the vessel was taken in charge by the American consul, and the men confined pending their examination, after which they were restored to the Globe, which was put in charge of Captain ——— King and sent to Nantucket. Ten men had been left at the Mulgraves,* but repeated injuries to the natives on the part of Silas Payne (the second in command of the mutineers at the time of the outbreak, and the murderer of his associate conspirator, Comstock), so incensed them that one after another of the crew were slain, the innocent perishing with the guilty, until on the arrival of a United States vessel, which had been sent there to rescue the survivors, but two remained alive.†

In an account of this sad affair, published by Messrs. Lay and Hussey immediately after their rescue, is related the following incident as showing the gross brutality of Comstock, the chief of the mutineers, and the miserably slight pretexts by which they justified to themselves their diabolical plot and its carrying out. Some time previously to the mutiny Comstock, who was a boat-steerer, had desired a friendly wrestle with the third mate, Nathaniel Fisher. Mr. Fisher, being the more athletic, handled him with so much ease that Comstock, enraged at Fisher's superiority, struck him, whereupon the third mate laid him on deck several times quite severely. Comstock at the time made threats of vengeance upon Mr. Fisher, to which he paid no attention.

After murdering the captain and first mate, who were both asleep at the time of the assault, the mutineers proceeded to attack the second and third mates, who were in the cabin. Comstock had loaded two muskets, and on reaching the cabin-door he fired one of them in the

*One man was hung by the mutineers.

†William Lay, of New London, and Cyrus Hussey, of Nantucket.

direction in which he judged the officers were, shooting Fisher in the mouth. "They now," continues the account, "opened the door, and Comstock making a pass at Mr. Lumbert (the second mate), missed him, and fell into the state-room. Mr. Lumbert collared him, but he escaped from his hands. Mr. Fisher had got the gun, and actually presented the bayonet to the monster's heart, but Comstock assuring him that his life should be spared if he gave it up, he did so; when Comstock immediately ran Mr. Lumbert through the body several times. He then turned to Mr. Fisher and told him there was no hope for *him!* 'You have got to die,' said he, and he alluded to the wrestling affair between them, and the full force of the threats made at the time became apparent to the mind of the unfortunate second mate. Finding his cruel enemy deaf to his remonstrances and entreaties, he said, 'If there is no hope, I will at least die like a man!' and having, by order of Comstock, turned back to, said in a firm voice, '*I am ready.*' Comstock then put the muzzle of the gun to his head and fired, which instantly put an end to his existence." The body of the captain was brutally mutilated, and with those of the mates was thrown overboard, the first and second officers being, in spite of their terrible wounds, still alive.

Similar in diabolical atrocity, both in the lack of provocation and in the carrying out of the plot, was the outbreak on the ship Junior, of New Bedford, in 1857. The ship sailed in July of that year on a voyage to the Indian and Pacific Oceans. Christmas came, the day of hallowed associations to the natives of civilized countries, whether their place of sojourning be on the land or on the sea. The day passed tranquilly on board the ship, Captain Mellen serving to each of the crew in the evening a small glass of spirits to commemorate the return of the Christian holiday. To all outward appearance, this kindly act on the part of the captain, an act which has a specially friendly significance to the mariner, was appreciated and reciprocated in sentiment by the crew. This being accomplished, Captain Mellen retired to his cabin, and soon he and his officers were calmly slumbering in their berths, little dreaming that hands that had but just received the token of hospitality and good-feeling from them would, ere another sun had dawned, be reeking with their blood. The major portion of the crew, who also had no suspicion of the cold-blooded schemes of their comrades, also "turned in" to their berths and slept.

At about 1 o'clock in the morning of the 26th of December, the ring-leader in the mutiny, Cyrus Plummer, with four of his associates, all armed with guns cocked and extra-loaded, entered the cabin, having first stationed five others outside to prevent aid reaching the officers in case they gave the alarm. With the muzzles of their guns almost touching the bodies of their victims, the conspirators, at the word from Plummer, fired. Three bullets pierced the body of the captain, who was almost instantly killed. The first mate, shot by six balls, survived, The third mate was killed with a whaling-spade or lance as he rose.

wounded by the murderous muskets. Alarmed by the discharge of the fire-arms, the remainder of the crew rushed to the deck, where they were confronted by the whole force of the mutineers, those who had assaulted the officers hurrying up to aid those left on guard. In the confusion the first and second mate hid themselves from their would-be murderers. The loyal men of the crew, finding themselves completely in the power of the revolting ones, had no recourse but to submit. After the first burst of passion was over, the second mate made his appearance and his life was spared. The chief mate had secreted himself in the hold, where, in spite of the torture from his wounds, he remained for five days undiscovered, and when at last he was found, the mutineers required his services to navigate the vessel.

When within about twenty miles of the coast of Australia, Plummer and his accomplices, taking two whale-boats and rifling the ship of everything they could find of value, left the vessel and landed upon those shores, where eight of them were subsequently captured.*

With the opening of navigation in high latitudes came increased perils. Not sufficient were the dangers from their gigantic prey, or furious gales, or the losing sight of the ship; to these must be added the risk of being ground between two mighty ice-bergs, of being caught in some field of ice and forced ashore, of having the stout timbers of their vessel pierced by the glittering spear of some stray berg as it was driven by the force of the polar currents. The season in either northern sea lasts but two or three months, and the temptation to incur many risks for the sake of rapidly filling the ship is too great to be withstood. The life of the whale-hunter is a life of risks—this only adds a little more to his repertoire of exciting scenes.

Captain Pease, of the ship Champion, of Edgartown, in a letter published in the New Bedford "Shipping List," of November 29, 1870, thus describes some of the incidents of Arctic whaling: "We made and entered the ice on the 17th day of May, about 40 miles South of Cape Navarin, weather thick and snowing; on the 20th the weather cleared up, showing about a dozen ships in the ice. The weather having every appearance of a gale, I worked out of the ice, and soon found myself surrounded by fifty ships. Saw but one whale in the ice. On the 23d, weather pleasant, two or three ships worked a short distance in the ice; the next day the fleet commenced following, and in a few hours fifty ships were on a race to Cape Thaddeus; it was oak against ice, and like all heavy moving bodies which come in collision, 'the weakest structure always gives way;' so with the ships, they *all* came out more or less damaged in copper and sheathing—the Champion four days ahead to Cape Thaddeus, and in clear water.

*In 1853 the crew of the brig William Penn, of San Francisco, consisting of five whites and fifteen natives of the Pacific Islands, mutinied, killing the captain, Isaac B. Hussey, and one man, and badly wounding the first and second mates and another man. The second man died a few days after the outbreak.

"Unfortunately, for the first time since whaling, there were no whales. On the 13th of June, we lowered for a whale going quick into the ice, Cape Agchen bearing southwest 90 miles, and before getting the boats clear, the ice packed around us. From that time until the 26th, so close and heavy was the ice packed around us, that we found it impossible to move the ship. With our sails furled, we drifted with the ice about 12 miles per day toward Cape Agchen, the ship lying as quiet as in a dock, but on the 22d, when close under the cape, a gale set in from the southward, producing a heavy swell and causing the ship to strike heavily against the ice. We saved our rudder by hooking our blubber-hooks to it and heaving them well taut with hawsers to our quarters. Had the current not taken an easterly shore course, the ship must have gone on shore. The wind blowing on shore, which was distant less than half a mile, 5 to 6 fathoms of water under us, ship rolling and pounding heavily against the ice, weather so thick we could not see 50 yards, made it rather an anxious time. For 36 hours I was expecting some sharp-pointed rock would crash through her sides. On the 24th, finding only 4½ fathoms water, little current, with the larger pieces of ice around, we let go an anchor and held her to a large floe of ice. Here we broke our sampson-post off in the deck. On the morning of the 25th the weather cleared up, showing our position to be at the head of a small bay about 15 miles east of Cape Agchen. Here for two days we lay becalmed and ice-bound. On the second day the ice loosened, when we took our anchor and by 18 hours' hard work succeeded in kedging about 4 miles seaward; a breeze then springing up from off shore, we spread sail and passed into clear water. We spent a short time in the straits, but saw nothing of the bowhead kind. Passed into the Arctic July —, and found most of the fleet catching walrus; about a dozen ships (this one among the number) went cruising along the northern ice for bowheads. After prospecting from Icy Cape to near Herald Island, and seeing not a whale, I returned to the walrus fleet. The first ship I saw was the Vineyard, with 175 walrus; since then I have not seen or heard from her. This walrusing is quite a new business, and ships which had engaged in it the previous season and came up prepared were very successful. While at it, we drove business as hard as the best of them, but soon became convinced that the ship's company (taken collectively) were much inferior to many others; they could not endure the cold and exposure expected of them. I have seen boats' crews that were properly rigged, kill and strip a boat-load of walrus in the same length of time another (not rigged) would be in killing one and hauling him on the ice. We took some 400, making about 230 barrels. About August 5, all the ships went in pursuit of bowheads, (most of them to Point Barrow). When off the Sea Horse Islands we saw a few whales working to the westward, just enough to detain us; we took two making 200 barrels; the weather cold, and a gale all the time. In September I worked up about 70

miles from Point Barrow; saw quite a show of small whales in the sea; took four which made about 100 barrels. As that was a fair sample, and not having the right boys to whale in that ice, where the thermometer stood only 8 above zero, I went back to the westward. Ships that had from 40 to 50 men, (clad in skins), and officers accustomed to that particular kind of whaling, did well. In going back, the fourth mate struck a whale which made about 70 barrels. From the 28th of September to the 4th of October we saw a good chance to get oil, had the weather been good and a well, hardy crew. We could not cut and whale at the same time. We took four whales which would have made 500 barrels had we had good weather to boil them. On the 4th of October we put away for the straits, in company with the Seneca, John Howland and John Wells—a gale from northeast, and snowing. On the evening of the 7th it blew almost a hurricane; hove the ship to south of Point Hope, with main-topsail furled; lost starboard bow boat, with davits—ship covered with ice and oil. On the 10th, entered the straits in a heavy gale; when about 8 miles south of the Diomedes, had to heave to under bare poles, blowing furiously, and the heaviest sea I ever saw; ship making bad weather of it; we had about 125 barrels of oil on deck, and all our fresh water; our blubber between decks in horse-pieces, and going from the forecastle to the mainmast every time she pitched, and impossible to stop it; ship covered with ice and oil; could only muster four men in a watch, decks flooded with water all the time; no fire to cook with or to warm by, made it the most anxious and miserable time I ever experienced in all my sea-service. During the night shipped a heavy sea, which took off bow and waist boats, davits, slide-boards, and everything attacked, staving about 20 barrels of oil. At daylight on the second day we found ourselves in 17 fathoms of water, and about 6 miles from the center cape of St. Lawrence Island. Fortunately the gale moderated a little, so that we got two close-reefed topsails and reefed courses on her, and by sundown were clear of the west end of the island. Had it not moderated as soon as it did, we should, by 10 a. m., have been shaking hands with our departed friends."

Another difficulty of North Pacific navigation is mentioned in a letter from Capt. William H. Kelley, of the bark James Allen, of New Bedford, to the Hawaiian Gazette, in 1874.* He says: "One of the perplexities of the navigator cruising in the Arctic Ocean is the singular effect northerly and southerly winds seem to have upon the mariner's compass. Captains have noticed this singularity for years, and no solution of the matter, as far as I have learned, has yet been arrived at. Navigators have noticed that with a north or northeast wind they can tack in eight points, while with the wind south or southwest in from fourteen to sixteen points. All navigators know that for a square-rigged vessel to lie within four points of the wind is an utter impossibility, the

*See New Bedford "Shipping List," January 5, 1875.

average with square-rigged vessels being six points. This peculiar action of the compass renders the navigation of the Arctic difficult and at times dangerous, especially in thick, foggy weather. Navigators in these regions have proved to their satisfaction that on the American coast, north and east of Point Barrow, to steer a land course by the compass and allow the variations given by the chart, 44° 15′ east, with the wind at north or northeast, *would run the ship ashore, steering either east or west.* * * * * Experience, therefore, has obliged navigators to ignore the variations marked upon the charts, and lay the ship's course by the compass alone to make a land-course safe in thick weather. * * * * With an east or west wind the effect on the compass is not so great as with other winds. I have said this much to show the working of the compass in the Arctic Ocean during different winds, not that I admit that the wind has any effect whatever upon the compass. I give the facts as they came under my observation, and corroborative testimony will be borne by any shipmaster who has cruised in the Arctic Ocean."

Although in the earlier, and at times in the later years of Arctic whaling the yield of oil has been large, yet the extra expense of obtaining it has been a formidable element entering into the calculation on the profits of the voyage. The anchorage was found to be of that character that the ground-tackle in use in other oceans availed but little, and heavier anchors and cables had to be furnished to prevent the almost inevitable drifting upon a lee shore, which, in a heavy gale, lighter anchors and lighter cables could only postpone. Again, but few ships returned from these regions without showing heavy scars and wounds as the result of their contest with the ice, while many vessels laid their bones in these desolate seas and on the rock-bound coasts. The most memorable instance of loss from shipwreck in the Arctic is that of the season of 1871, when thirty-four vessels out of a fleet of forty-one were abandoned in the ice as hopelessly lost.

More particular stress has been laid upon the North Pacific fishery because the bulk of the Arctic whaling was carried on on the western coast, but the pursuit was carried on in Hudson's Bay* and the surrounding seas with no less danger and with no less loss when we consider the number of vessels engaged. Scurvy, that dread of the sailor, was more to be feared in the North Atlantic than in the North Pacific Ocean.† Vessels usually fitted for shorter voyages, and the sudden closure of the ice around them, cutting them off from all communication with the outside world, attended as it was with a distressing uncertainty as to when their imprisonment would terminate, was an event that was positively appalling. The long catalogue of whale-ships crushed by the ice, which

* Malte Brun says (v, p. 76, ed. 1826,) "All attempts at whaling in Hudson's Bay are unsuccessful."

† The Ansel Gibbs, of New Bedford, was lost in the ice in Hudson's Bay, October 19, 1872. Fifteen of her crew died of scurvy before they were freed from their icy prison.

is an accompaniment to the history of the English fishery in the Greenland seas, is ample attestation to the perils North Atlantic mariners were obliged to encounter, and ample testimony to the bravery and hardihood of those men, English, Dutch, and American, who pursued their prey amid so much of danger, privation, and suffering.*

The American Greenland sea-fishery affords but few examples of these perils, simply because the fleet in these waters was of late years very small. Vessels have sailed on their voyages to Hudson's Bay and Davis Straits and never returned, and the fate of the gallant men who composed their crews has been and must ever remain a mystery.

Mention has been made more particularly of those sources of disaster more peculiar to the business, but it must not be inferred that these are the only trials which beset the life of the whaleman. In common with, but probably not in proportion to, the merchant service, the scenes of shipwreck and suffering are alike the shadows darkening the sunshine of their lives; shipwrecks, resulting not from the nature of their avocation, but the result of gales, of fire, and of sudden calamity.

On the 4th of March, 1854, the ship Canton, of New Bedford, was wrecked on a reef in the Pacific Ocean situated in 2° 45′ south latitude, and 173° west longitude. The crew gained the shore of a small barren island, and there subsisted as best they could for four weeks. During this time, in the best procurable shade, the thermometer denoted a temperature of 135° by day and 94° by night. Long existence there was out of the question, since their only source of supplies was the wreck of their vessel, and it was determined to endeavor to reach the King's Mill group of islands, some eight hundred miles distant. Having procured a very limited stock of bread and water, they started in four boats, reducing themselves to an allowance of one-half a pint of water and half a biscuit per day to each man. During the night the boats

* One of the most horrible tales of suffering in the annals of the whale-fishery is that of the English whaleship Diana, which left the Shetlands in 1866 for an Arctic (Davis Strait) voyage, with a crew of fifty officers and men. The time for her return came and passed, and nothing was heard of her whereabouts or fate. A premium was offered for tidings from the missing vessel, and at last she brought her own intelligence. On the 2d of April, 1867, the people living near Rona's Voe were startled by seeing the ghastly wreck of a ship sailing into the harbor. Battered, ice-crushed, her sails and cordage cut away and dismantled by the rigors of her terrible imprisonment, her boats and spars cut up to feed the fires which kept the wretched crew from freezing, her decks strewed with the dead and dying, the long lost Diana returned. The fifty who sailed were all brought back, but how? Ten bodies, one of them the captain's, lay on the deck carefully arranged for that burial which their comrades could not bring themselves to give to them. Thirty-five lay helplessly sick, some of them dying. Two still retained strength enough to go aloft, and three more were able to crawl around on deck. The man at the wheel fainted with excitement when help was at hand. One of the sick died in his berth after the rescuers had boarded the ship. The surgeon had worked untiringly, but cold, hunger, scurvy, and dysentery had done their work as unceasingly. The captain was the first to succumb, and one by one the others followed him. Another night and the ship which had been for all a common home would have proved to all a common tomb.

were kept together, but in the day-time they separated as widely as was prudent, to increase their chances of seeing a sail. On their perilous voyage they encountered considerable severe weather, and passed the islands where they intended to stop. When at length, after a voyage of forty-five days, they landed at Sypan (one of the Ladrones), not one of their number was able to stand. Here they caught birds and fish, and obtained cocoanuts, but no water, and they again started, this time for Tinian, distant about thirty miles. Arrived off there, the commander refused to allow them to land, thinking they were pirates. He even ordered his soldiers to fire upon them, but they finally convinced him who they were, and he supplied them with bread and water. Four days after they landed at Guam, having sailed in their boats about thirty-five hundred miles.

On the 21st October, 1851, the ship Junius, of New Bedford, was lost on a reef in Mozambique channel. The crew left the ship, unable to secure any provisions save four salt hams. All but one boat's crew landed at Saint Augustine Bay, about two hundred miles from the scene of their shipwreck, having been in their boats six days and nights without water and with no food except the hams, which to men in their situation were worse or but little better than no food. The missing ones were subsequently rescued.

The ship Logan, of New Bedford, was lost January 26, 1855, on Sandy Island Reef. A boat-steerer and three men were drowned at the time. The survivors landed at the Feejee Islands after enduring much suffering.

In 1846 the ship Lawrence, of ———, was lost off the coast of Japan, and of the entire crew only the second mate and seven men reached the shore alive. They were immediately seized by the Japanese and kept for seventeen months in the most rigorous and barbarous custody, in cages, dungeons, holds of junks, &c., and passed from port to port until they reached Nangaski. On their journey they were exposed to all sorts of ill-treatment, were threatened, insulted, and sometimes cruelly beaten. One poor fellow who endeavored to escape these brutal captors was cruelly put to death. At Nangaski the wretched remnant were compelled to go through the ceremony of trampling on the cross or a representation of it, in accordance with an edict adopted at the time of the expulsion of the Portuguese some two hundred years before.* At the

* The ship Manhattan, Budd, of Sag Harbor, had visited Jeddo less than twelve months before to restore to their home 22 Japanese seamen whom they had rescued from a wreck. They had been hospitably received, but warned not to come there again. Vessels which have been classed as missing—as for instance the Lady Adams of Nantucket in 1823—have been last seen off that coast. If dire necessity drove their crews upon that inhospitable shore, what scenes of barbarity may have been enacted in which they were the struggling and helpless victims! (NOTE.—Although these accounts of the Lawrence and Lagoda are current in the newspapers of the time and even remembered indistinctly by whalemen who were near Japan, it has been impossible to find these vessels among the whaling-lists before the alleged accidents.—THE AUTHOR.)

very time these atrocities were being perpetrated the squadron of Commodore Biddle lay in the harbor of Yeddo, and our Government fondly imagined that it had made a favorable impression on the people of those islands in respect to American dignity, moderation, and power.

Similar to the experience of the Lawrence was that of the Lagoda, of New Bedford, also wrecked on these, then inhospitable, islands. Those of the crew who survived the wreck were so inhumanly treated by the Japanese into whose power they were so unfortunate as to fall that one of their number in sheer despair relieved himself of further torture by taking his own life.*

Another class of accidents to which whalemen seem peculiarly liable, but which, because of the care and vigilance exercised by the officers and crew, is of rare occurrence, is destruction by fire.† When indeed this casualty does occur, it is usually the result of some circumstance which might occur in any vessel. The case of the Cassander, of Providence, R. I., Henry Winslow commander, was one of this kind, and its narration is given, not so much in illustration of perils incidental to this pursuit, as to record the sufferings of her crew on account of that disaster.

Vessels in the merchant service have, as a general rule, a certain series of courses to steer. They usually make the shortest distance from port to port. Hence in case of accident to the vessel they are in, the crew have only to continue in their course in order to insure most speedy relief. Not so with the whaler. Her cruising ground may be hundreds of miles from the tracks of merchantmen, and she may be a solitary cruiser on that station. Hence the destruction of the vessel involves far greater risk and possibly privation and suffering to the crew.

The Cassander sailed from Providence on the 19th of November, 1847. Nothing worthy of special mention occurred until, on the morning of the 1st of May, 1848, between 4 and 5 o'clock, the cry of fire was raised.‡ The wind at the time was blowing a moderate gale from the northwest. All hands were instantly on deck, and search for the source and cause of the fire was made. It was found that it was raging most severely in the lower hold, apparently near the foremast, where four barrels of tar

* Fifteen of the crew of the Lagoda reached the shore alive; one subsequently died, a victim to the barbarities of his captors; the thirteen survivors were rescued by the United States ship of war Preble in 1849. The Preble also took on board a sailor named Ronald MacDonald, formerly of the whale-ship Plymouth of Sag Harbor. MacDonald received his discharge and was given a whale-boat furnished with books, provisions, &c., and left the ship off Japan in June, 1848, with the expressly avowed purpose of visiting the Japanese islands. He landed upon one of them and was immediately captured, deprived of his books, and imprisoned. Having nothing to occupy his time he turned his attention to teaching his captors the English language, and soon had quite a class receiving instruction. But his presence was a thorn in the side of the Japanese, and they availed themselves of the first opportunity to get rid of him.

† Incendiary fires, which became of disastrous frequencey in later years, are not meant when we speak of this immunity.

‡ This account is taken from that of the captain, published in the Baltimore Sun.

were known to have been stored. Simultaneously with this discovery it was found that two of the crew—negroes from the coast of Africa—had jumped overboard. One of them, refusing to take the rope thrown to him by Captain Winslow, soon sank, the other was subsequently picked up by the second mate's boat.*

Orders were given, and every exertion was made to save the ship, but the position of the fire, the rapidity with which it increased, and the density of the smoke, rendered all their efforts unavailing, and the means of escape became the chief consideration. Attempts were made to procure bread and water, but the smoke in the steerage was so dense that it was impossible to do so. This circumstance led to the belief that the ship had been fired at both ends. Three boats were now lowered, and in them were placed such stores as the crew could get at, the nautical instruments and some clothing, and the burning wreck was abandoned, the entire crew, save the drowned African, numbering in all 23 souls, escaping in safety.

With the dawning of the day they took an inventory of their supplies and found them to consist of about ten gallons of water, fifteen pounds of bread, and a small amount of raw meat taken from the harness-cask. By the previous day's reckoning their position was found to be in latitude 34° 30′ south, longitude 45° 50′ west—400 miles from the nearest land. The crew were immediately allowanced to one gill of water and a very small amount of bread per day. The weather was bad, and during the earlier portion of their voyage they were obliged to depend upon their oars to make progress against the head winds. Of course they soon became exhausted, and rowing had to be given up and the sails alone were used, the boats being kept as nearly as possible in the direction of land.

At about 10 o'clock on the morning of the 5th of May, the boats being then in latitude 32°, longitude 47°, a sail was discovered. All hands immediately took to the oars, and after five hours of hard rowing, signals of distress being also repeatedly made, the mate's boat came up with the vessel and found her to be a Spanish brig, 100 days from Barcelona, bound to Montevideo. The captain of the brig made every effort to get away from the shipwrecked mariners, and when the mate's boat came up would not allow it alongside, but passed the crew a rope and towed them some distance astern. When Captain Winslow's boat came up he stated to the Spaniard, through an interpreter, their condition and circumstances, and asked permission for his officers and crew to go on board, but this was peremptorily refused. Equally futile were the endeavors to get him to take them to Montevideo or St. Catharine's, or even one or two days' sail toward land. The stony-hearted man, with a refinement of cruelty entirely foreign to maritime men, paid no heed

*The rescued negro confessed that the ship had been fired by his drowned companion and himself. Their fears of being sold into slavery had been excited, and this desperate act was performed as a means of escaping, through death, that more miserable fate. Before leaping into the sea his companion had stabbed himself.

to their entreaties, nor would he even permit them the solace they could derive from one night's rest and sleep on board his vessel, that they might the better withstand the further fatigues and hardships in store for them. Against the express wishes of this monster, Captain Winslow sprang into the main chains and aboard of the vessel, but the aid which the unfortunates wanted the Spanish captain could not be induced to give, and the crews of toil-worn, famishing, abandoned men proceeded on their voyage. Who would not say that if the sea, which proved more hospitable than man, had swallowed up these miserable men, their blood would have been on the head of Captain Dominick, of the brig Alercidita?*

The night of the 6th was the most perilous of their voyage, as the wind blew in a succession of heavy squalls. The boats were hove to by making a line fast to the oars and paying them out ahead. In this situation they lay until the dawn. From daylight until 11 o'clock they used their sails, but the wind blowing a heavy gale from a northeasterly direction they were again compelled to heave to. At about 4 o'clock in the afternoon the captain's boat was swamped, but the occupants were all rescued and divided between the other two boats. By this accident the water and the nautical instruments it contained were lost, and the two remaining boats were so loaded that their gunwales were not more than 6 or 8 inches out of water. "In this situation," says the captain, "we passed the night; nothing was heard save the awful roaring of the tempest and occasionally the voices of some of the officers and crew offering up a prayer to the Almighty Ruler of wind and wave for their safety. He heard our prayers. In the morning the wind moderated and the sea was beaten down by a heavy shower of rain." From this time they were favored with pleasant weather, and on the 10th of May they landed near Conventus, in the province of St. Catharine, in Brazil, without water and utterly exhausted. So much reduced had they become that a boat-steerer was drowned by the capsizing of the mate's boat, he being too weak to extricate himself from the surf.

It would be easy to greatly extend the mournful lists, but those enumerated are types of each class of casualties. Still another class appears, however, and with this we will pass to the consideration of other subjects.

Among the dangers encountered by our whalemen in the Pacific Ocean is the serious and insidious one of the attacks of boring-worms upon the bottoms of their ships. The least exposed place upon their planking where the copper may have become chafed off by contact with sunken rocks and reefs, without a thought of danger incurred or damage done presenting itself to the mariner, serves as a rallying point for the teredo, and soon the vicinity of the break becomes honey-combed with its habitations, and fortunate is it for the seamen if a warning leak drives them into some haven for repairs while yet the damage is repar-

*On his arrival in port Captain Dominick reported that he had *tendered them help, which they refused.* As though drowning men ever refused substantial aid!

able. This may be still another plausible solution of that terrible problem of "missing vessels." A noteworthy instance of the havoc made by these "toilers of the sea" occurred to the ship Minerva 2d, of New Bedford, Captain Swain, in 1857.

In August, 1856, while off the King's Mill group, she touched on a reef, the water being at the time perfectly smooth and but little wind blowing. So trifling was the sensation of the contact that Captain Swain gave himself no thought that any damage was sustained, and the voyage was continued as usual until February, 1857, when, in a heavy gale, the vessel was found to leak 250 strokes per hour. She reached Norfolk Island on the 19th of March, but was blown off by heavy gales which continued for three days, the leak meanwhile increasing to 1,000 strokes, and Captain Swain bore away for Sydney. On the 29th of March she was leaking 2,400 strokes (or about 16 inches) per hour, and Captain Swain had the forehold cleared to examine for the cause of the trouble. Upon cutting through the ceiling several holes were found in the bottom through which the water rushed furiously. These the men, though standing in the water up to their middles, succeeded in plugging up and covering with canvas and blankets well tarred. Over these a stream-chain was coiled to prevent the plugs from bursting in from the force of the water, and the pumps were kept going day and night. The ship reached Sydney on the 7th of April and was taken upon the marine railway. Upon examination it was found that two sheets of copper had been rubbed off (probably while off the King's Mill Islands) about six feet from the keel, and a little abaft the bluff of the bow on the starboard side. When this place was laid bare the planks were completely eaten to a shell by the worms. No person not an eye-witness, said the captain, would have believed the planks would have held together, and it was certainly wonderful that in plugging the whole plank was not driven out, in which case every soul on board must have been drowned before the boats could have been lowered.*

G.—A MISCELLANEOUS CHAPTER.

While some vessels on their voyages have made but poor returns, even bringing, in numerous cases, positive and at times damaging loss to their owners, others have done extraordinarily well, and brought in fortunes to those investing in them. The ups and downs of the business made it alternately profitable and, if not positively losing, at least hazardous. This was the fact when no unusual accident occurred, but in case of a disaster it changed the beam of the balance from the speculative to the unmistakably negative side of the account. To illustrate the two phases of the owners' business experience, the following examples are given:

The Wilmington and Liverpool packet, Captain Richmond, sailed from

*The new ship Niphon, of Nantucket, on her first voyage, sunk at sea on her passage home, January 12, 1849, in consequence of the depredations of ship-worms.

New Bedford in June, 1820, for the Pacific Ocean, returning on the 27th of December, 1823, with 2,600 barrels of sperm-oil—the largest amount procured by any one New Bedford ship to that date, and worth, at the average price of oil in 1823, about $65,000.

The ship Uncas, of Falmouth, Capt. Henry C. Bunker, sailed in 1828 and returned in 1831, having been absent two years and eight months, bringing a cargo of 3,468 barrels of sperm-oil, worth about $88,000.

The Loper, of Nantucket, Capt. Obed Starbuck, returned in September, 1830, after an absence of only fourteen months and fourteen days, with 2,280 barrels of sperm-oil, worth, at the average price of oil, $50,000. On her next voyage, under the command of John Cotton, she took 2,170 barrels of sperm-oil in less than eighteen months, and on the voyage immediately preceding that of 1829-'30, under the command of Captain Starbuck, she brought in 2,131 barrels of sperm-oil in less than seventeen months. In less than sixty-two months she had performed three Pacific Ocean voyages and landed 6,581 barrels of sperm-oil.

The ship Sarah, of Nantucket, Capt. Frederick Arthur, sailed for the Pacific Ocean on the 26th of May, 1827, returning April 19, 1830, with 3,497 barrels of sperm-oil, valued at $89,000. This is the largest quantity of sperm-oil ever brought into Nantucket from a single voyage.

In 1830 the ship America, Capt. Shubael Cottle, sailed from Hudson, N. Y., for the Pacific Ocean. She returned in 1823, after a voyage of thirty-one months, bringing 3,180 barrels of sperm-oil. The value of her cargo was about $80,000.

The Magnolia, of New Bedford, Capt. George B. Worth, obtained a cargo of 3,451 barrels of sperm-oil on a voyage of forty-one months, the value of which was $85,000.

In 1838 there arrived at New Bedford the ship William Hamilton, Capt. William Swain, with 4,060 barrels of sperm-oil, having sent home from the Western Islands on her passage out 121 barrels more, making a total of 4,181 barrels, worth $109,269.

In 1842 the America, Captain Fisher, brought into New Bedford 400 barrels of sperm and 4,300 barrels of whale oil, and 45,000 pounds of bone, after a voyage of 26 months, the entire cargo being worth $66,478. In the same year the Maria, of Nantucket, Capt. Elisha H. Fisher, returned from a 22 months' voyage with 2,413 barrels of sperm-oil, bringing to the owners the sum of $70,000.

In 1843 the Silas Richards, of Sag Harbor, returned with 3,600 barrels of whale-oil, 220 of sperm, and 30,000 pounds of bone, having been gone 28 months. The value of her cargo was $54,722. In the same year the Bowditch, of Providence, carried into that port 3,500 barrels of whale-oil and $10,000 worth of bone, the value of which cargo was $47,485; she was gone 20 months. The schooner Cordelia, of Provincetown, also returned in 1843 from a *four days' voyage* with 120 barrels of whale-oil and $100 of bone, worth $1,385

In 1845 the Lowell, Captain Benjamin, and the General Williams, Captain Holt, arrived at New London, the former having been gone 21 and the latter 22 months, each bringing about 4,500 barrels of whale-oil and 43,000 pounds of bone, each cargo being valued at about $61,400. The Lowell was said to have had alongside *at one time sixteen whales.*

In 1849 the South America, of Providence, Capt. R. N. Sowle, returned from a voyage of 26 months, with 5,300 barrels of whale and 200 barrels of sperm oil, and 50,000 pounds of bone, worth $89,000. As she fitted at $40,000, it will be seen that she paid her cost and a dividend of about 125 per cent. The Russell, of New Bedford, Captain Morse, also brought to her investors, in the same year, a cargo valued at $92,000, (2,650 barrels of sperm-oil.) She was absent three years and four months. The cargo of the Plymouth, of Sag Harbor, Capt. L. B. Edwards, which also returned in 1849, was worth $71,000. She brought 4,873 barrels of whale-oil, and was gone 41 months.

In 1850 the Coral, of New Bedford, Captain Seabury, returned from a three years' voyage with 3,350 barrels of sperm-oil, worth $126,630.

Probably the most extraordinary voyage ever made was that of the Envoy, of New Bedford, which sailed in 1848. She returned to Providence in 1847 from a whaling voyage, and was there condemned and sold to William C. Brownell, esq., of New Bedford, to be broken up. Mr. Brownell, however, concluded to fit her for another voyage, and did so, sending her to sea under the command of Capt. W. T. Walker.* She sailed immediately to Wytootacke, and took on board 1,000 barrels of oil that Captain Walker had purchased from a wreck on a previous voyage at a merely nominal price,† and stored there; thence he proceeded to Manila and shipped this oil to London. From Manila he cruised in the North Pacific Ocean, and in fifty-five days took 2,800 barrels of whale-oil. Of this he shipped to London from Manila 1,800 barrels, and also 40,000 pounds of bone. Cruising again he took 2,500 barrels of whale-oil and 35,000 pounds of bone. Captain Walker now put into San Francisco, sold 25,000 gallons of oil at $1 per gallon, and the remainder (85,000 gallons) at 51 cents per gallon, and shipped $12,500 worth of bone to New Bedford. While at San Francisco an offer of $6,000 was made for the vessel. The gross amount of oil obtained was 5,300 barrels, and of bone 75,000 pounds. Summing up, then, the entire result of the voyage, we find:

Net profit on 1,000 barrels first shipped to London	$9,000
Net profit on catchings for first season	37,500
Sales at San Francisco	73,450
Value of bone shipped home	12,500
Value of vessel at San Francisco	6,000
	138,450

The Envoy was fitted at about $8,000.

* The underwriters declined to insure her.

† Wrecked oil was sometimes purchased at from fifty cents to one dollar a barrel.

The year after the cruise of the Superior in the Arctic, 154 ships were whaling in that sea. These vessels took during that season (1849) 206,850 barrels of right-whale oil and 2,481,600 pounds of whalebone. The value of the ships and outfits was $4,650,000, and the value of that season's catchings was $3,419,622.

In 1853 the following more than ordinarily good voyages were reported at New Bedford: Bark Favorite, of Fairhaven, Captain Pierce, gone three years, with 300 barrels of sperm and 4,300 barrels of whale oil and 72,000 pounds of bone,* worth in the aggregate $116,000; ship Montreal, of New Bedford, Capt. Frederick Fish, absent 32 months and 15 days, with 195 barrels sperm, 3,823 barrels whale-oil, and 31,700 pounds of bone, worth $136,023.19; ship Sheffield, also of New Bedford, gone four years, with 7,000 barrels of whale-oil and 115,000 pounds of bone, worth $124,000.

The Pioneer, of New London, Capt. Ebenezer Morgan, sailed from that port June 4, 1864, for the Davis Straits and Hudson's Bay fishery, valued, with her outfits, at $35,800. On the 18th of September, 1865, she returned with 1,391 barrels of whale-oil and 22,650 pounds of bone, worth, at the current prices, $150,060.† This voyage the people of New London claim to be the best ever made by an American whaler.

But success has not been confined to large vessels or to expensive voyages. In addition to the cruise of the Cordelia, of Provincetown, there are reported as making extraordinary voyages the following small vessels: The schooner Admiral Blake, of Sippican, Capt. B. B. Handy, in a voyage of two months and nine days (in 1854) took 250 barrels of sperm and 10 barrels of blackfish oil, worth, in all, $11,000. The schooner Altamaha, of the same port, Capt. Consider Fisher, sailed in 1855, was gone six months and nine days, and returned with a cargo of 240 barrels of sperm and 8 barrels of blackfish oil, valued at $13,500. She was worth, with her outfits, $2,200, and after paying off her crew and refitting for another voyage the owners divided $8,000. The schooner James, also of Sippican, Capt. B. B. Handy, sailed in 1856, and in a cruise of three months and a half obtained $10,000 of oil (220 barrels sperm.)

Occasionally some piece of good fortune, out of the ordinary course of whaling success, is met with. Thus, in September, 1857, the schooner Watchman, of Nantucket, Capt. Chas. W. Hussey, sailed for an Atlantic Ocean cruise. She returned in August, 1858, having obtained 41 barrels of sperm and 386 barrels of whale oil, and 4 barrels of ambergris.‡ This last was sold for $10,000, making the entire value of the voyage $19,125.

So much for the cheering, sunny side of the picture. There is, however, a shadowy side, on which may be found heavy and disastrous

* Prior to the commencement of Polar whaling, the amount of bone taken bore to the number of barrels of whale-oil the proportion of 8 or 10 to 1. A vessel taking 2,000 barrels of whale-oil would be reasonably supposed to bring home (when they saved it) from 16,000 to 20,000 pounds of bone. But Arctic whaling destroyed all these calculations, for the bone was larger and the proportion yielded much greater.

† This was at a time when oil and bone commanded a good price.

‡ Ambergris is generally considered as a product of the rectum of a diseased whale.

losses, and financial ruin for many a merchant. Thus, of the 81 whalers expected to arrive in 1837, 53 made paying voyages, 8 made saving ones, 11 lost money, and 9 involved their owners in severe losses. A mutiny among the crew of the Clifford Wayne, of Fairhaven, necessitating her return to port, occasioned a loss of $10,000 to those who invested in her.

The brig Emeline, of New Bedford, Captain Wood, sailed from port on the 11th of July, 1841. The captain was killed by a whale in July, 1842, and in September, 1843, the brig returned, bringing home only 10 barrels of oil as the result of a 26 months' cruise.

The Benjamin Rush, of Warren, Captain Munroe, sailed in October, 1852, for the Pacific Ocean. On the coast of Japan the captain and his boat's crew were lost by a whale. This, combined with the extremely poor success that had attended the vessel, had so discouraging an effect upon the crew that it was considered useless to prolong the voyage, and she returned to port under charge of the cooper in 1853, having obtained but 50 barrels of sperm-oil and 40 of whale. On her voyage she had circumnavigated the globe, and during the entire period sighted land but twice, the Cape de Verde Islands, outward-bound, and Trinidad on the passage home.

Of the 68 whalers expected to arrive in New Bedford and Fairhaven in 1858, 44 were calculated as making losing voyages, and the same proportion would apply to other ports. The estimated loss to owners during this year was at least $1,000,000.

The net loss on 12 whaling schooners of the Provincetown fleet, which arrived in 1870, was $36,000.

These are cases taken somewhat at random. Almost every year witnessed some misfortune, saw some persons impoverished by an unsuccessful termination of the venture in which their little all was invested.

Among the pursuits which grew out of the prosecution of the sperm-whale fishery was the manufacture of candles, which was at one time an important industry both home and commercial.

"The first manufactory of sperm candles in this country," says Macy,* "was established in Rhode Island, a little previous to 1750, by Benjamin Crabb, an Englishman. His candle-house was burnt in 1750 or 1751." In 1750 the general court of Massachusetts granted to Benjamin Crabb, of Rehoboth, the sole right to make sperm candles in that colony for a term of years, on the ground that he and no other person had a knowledge of the art and he agreeing to instruct five of the inhabitants therein.† In 1753 Obadiah Brown built candle-works at Tockwotten, now

*Macy's Hist. Nant., p. 69. Mr. Macy must, for reasons enumerated in the succeeding note, be slightly in error in this date.

†Mass. Col. MSS., Manufactures, p. 369. The memorial does not seem to be on file. The documents relating to it are as follows:

"ANNO REGNI REGIS GEORGII SECUNDI VICESSIMO QUARTO: *An Act for Granting unto Benjamin Crabb the Sole priviledge of making Candles of Coarse Sperma Cœti Oyle:*

"Whereas Benjamin Crabb of Rehoboth in the County of Bristol has Represented

known as India Point, in Providence, and engaged Crabb to superintend the business. Brown manufactured that year about 300 barrels of spermaceti, which was nearly all that was saved separately from the body-oil, and not sent to England. Crabb proved less capable than Brown supposed, and the secret of refining was only acquired by Brown as the result of his own experiments.

In 1754 or '55, Moses Lopez engaged in the business in a small way, at Newport, followed soon after by Collins & Reveria, Aaron Lopez, John Maunsley & Co., Thomas Robinson, and others. In 1761 there were eight manufactories in New England and one in Philadelphia. These were: in Providence, Obadiah Brown & Co., the firm consisting of

to this Court that he (A) *has the Art of making Candles of Coarse Sperma Cæti Oyle* and has been at Great Expense in providing himself with proper Implements therefor and s Willing on due encouragment to undertake and Carry on that Business here and to Teach and Instruct Some of the Inhabitants of this province his Art Aforesaid, and this Court being Willing to Encourage an undertaking so likely to prove Beneficial to the province:—

"Therefore Be it Enacted by the Lieut-Governour, Council And House of Representatives—That the said Benjamin Crabb and his Heirs shall and may have and enjoy the Sole use, Exercise and Benefit of making Candles of Course Sperma Cæti Oyle (B) *Within this province for Sale for the Term of Fourteen years next ensuing the publication of this Act provided he forthwith engage in and Carry on the Business Aforesaid within this province During that Term and Do Instruct Five of the Inhabitants of this province the Art Aforesaid Within Ten years after the publication of this Act*—.

"And be it further Enacted by the Authority Aforesaid that no person or persons saving such only as shall first obtaine the Consent of the said Crabb or his Heirs signified under his or their hands shall Sell Within this province or Export out of it any Candles made of the Oyle (C) Aforesaid during the time the said Cobb And his Heirs are Entitled to the priviledge Aforesaid other than Such as are made by the said Crabb his Heirs or Assigns on pain of Forfeiting Ten pounds For each offence."

This bill passed its three readings on January 25, 1750, and was sent to the council for concurrence. On the 6th of February the council returned it with these amendments, viz: "Insert at A:—And no other Person in the Province has the Art of pressing, fluxing & chrystalizing of Sperma Ceti & course Sperma Ceti Oyle, and of making Candles of the same as so prepared. Insert at B:—So prepared untill the 31 day of May which shall be in the year of our Lord 1759 Provided that He do forthwith engage in & carry on the business aforesaid within this Province: and shall some time before the 31 day of May 1752 remove to some place within seven Miles of the Town of Boston & there set up Works suitable for carrying on the said Business; and shall then & there manufacture all such quantities of Oyl as can be procured fit for the purpose; and shall likewise within five years from the publication of this Act well & fully instruct five of the Inhabitants of this Province (two of whom shall be appointed by General Court if they see cause) in the Art aforesaid. Insert at C:—prepared as."

(The amendments A and B would strike out the words italicized.)

The house concurred with amendment A, and returned the bill to the council, who, though first non-concurring, finally, on the 12th of Feb., 1750, agreed with the amended house bill.

It will seem evident that this Benjamin Crabb and the one mentioned by Macy must be the same party, in which case he must have presented his petition late in 1749; and there is scarcely a chance that he was manufacturing in Rhode Island prior to 1750. There seems no means of knowing whether he ever pursued his occupation in Massachusetts or not. According to Macy it would appear that for some reason he did not accept the terms of the act.

Obadiah, Nicholas, Joseph, John and Moses Brown."* In Boston, Joseph Palmer & Co., consisting of Thomas Fluekar, Nathaniel Gorham, Joseph Palmer, Richard Cranch, and William Belcher. In Newport, which monopolized by far the largest share of this pursuit, were Thomas Robinson & Co., (William, Thomas, and Joseph Robinson, and William Richardson), Riveria & Co., (Henry Collins and Jacob Rod Reveria), Isaac Stelle & Co., (John Marodsley,† Isaac Stelle and John Slocum), Naphthali Hart & Co., (Naphthali, Samuel, Abraham, and Isaac Hart), Aaron Lopez and Moses Lopez. There was also, besides the Philadelphia firm, the name of which is not now accessible, one more manufactory, that of Edward Langdon & Son, which was probably located in Boston.‡

In 1761 Richard Cranch & Co. endeavored to associate the manufacturers for mutual protection in regard to the purchase of "head-matter" and the sale of manufactured stock. Such was the success of the project that the union was formed and articles drawn up and signed by all the above parties save Moses Lopez and the Philadelphians. The signers formed a general association under the name of "United Company of Spermaceti Chandlers." It was agreed to give positive orders to their agents not to give for head-matter more than £6 sterling per ton above the price of "common merchantable Spermaceti body brown oil," the price of the oil to be determined in all cases by the current prices paid by Boston merchants for the London market, and the members were debarred giving, either directly or indirectly, more than the above rate, or to receive any head-matter acknowledged by the seller to be pre-engaged. No commission exceeding 2½ per cent. was to be allowed to any factor; and if the price of head-matter should continue above the agreed price of the association, the members of the company agreed to fit out at least twelve vessels for whaling, each house furnishing and owning in the fleet equally; the number of vessels was to be increased from time to time as occasion required. No house was to manufacture for any parties not belonging to the association, and new partners could only be admitted by unanimous consent. Candles were not to be sold in New England at a less price than 1*s.* 10½*d.* sterling per pound, an additional shilling to be charged for each box made to contain 25 pounds.

The quantity of head-matter brought into New England was found insufficient to supply the number of factories already at work; and each member of the company was under obligation to do all in his power by fair and honorable means to prevent any increase of competition.

* The name of this firm was changed in 1763 to Nicholas Brown & Co. This account of the early sperm-candle factories is compiled from Macy's History of Nantucket, from a communication to the Providence Journal signed "M.," and from newspapers and memoranda of the time.

† Probably the same name as Macy spells Mausley.

‡ "M." says: "We cannot give the locality of this house." It is judged by the writer, however, to be located in Boston, from the fact that a few years later (in 1769) one John Langdon carried on the sale of sperm oil and the manufacture of candles in that town "in Fleet street, near the Old North Meeting House." In the same year candles of this kind are advertised as made by Russell & Howard, of Boston, and Daniel Jenckes & Co., of Providence.

Obadiah Brown & Co., with one or two others, were empowered to call a special meeting at Taunton if the influence of the whole company was required. Two general meetings were ordered, one for the first Tuesday in November, 1762, and the second for the first Tuesday in March, 1763. Expenses were to be apportioned *pro rata*, and at least one member from each firm was required to be present under a penalty of $8 for neglect to attend. The absentees were to be bound by the unanimous vote of the company's representatives, and the association could be dissolved upon evidence under the hand of one credible witness that one or more members of the copartnership had broken the agreement.

At a meeting held in Providence on the 13th of April, 1763, some slight alterations were made in the agreement. Ten pounds sterling was the price to be paid for head matter, and the members agreed to receive it only of following parties who were appointed the factors of the company: John & William Rotch, Sylvanus Hussey & Co., Folger & Gardner, Robert & Josiah Barker, Obed Hussey, Richard Mitchell, and Jonathan Burnell, of Nantucket; Benjamin Mason, of Newport; George Jackson, of Providence; and Henry Lloyd, of Boston. All such matter was, after the date of these revised articles, to be common stock, whether obtained by the company's or other vessels, and to be divided in the following proportion of parts to the hundred: Nicholas Brown & Co., 20 barrels; Joseph Palmer & Co., 14; Thomas Robinson & Co., 13; Aaron Lopez, 11; Rivera & Co., 11; Isaac Stelle & Co., 9; Naphthali Hart & Co., 9; the Philadelphians, 7;* Edward Langdon & Son, 4; Moses Lopez, 2.* The factors were to divide their purchases according to the above rule, and dishonorable conduct by any member in endeavoring to obtain an advantage over his fellow-partners entailed a forfeiture of the whole share.

John Slocum, Jacob Rod Rivera, Thomas Robinson, and Moses Brown were appointed to treat with the factors at Newport and Nantucket, John Brown with the one in Providence, and Joseph Palmer with the one in Boston. These gentlemen were to report to Nicholas Brown & Co., who were in turn to report to the other manufacturers.

There is no means at hand of arriving at the results of the partnership and manufacture; those enumerated were by far the principal parties engaged, though there were subsequently many others in Newport, Nantucket, and other towns with a large aggregate capital. The expense, says "M.,"† of a manufactory was trifling. The building was of wood, usually about 60 feet by 30 feet, one-half formed with 14-feet posts and used as a work-room, the other half with 8-feet posts and used as a shed. Building and utensils cost about $1,000, and about 600 barrels of head matter would be used up each year in such a factory.‡

The process of manufacture was so carefully kept a secret that it was not until 1772 that the people of Nantucket acquired sufficient knowl-

* By this agreement it would seem that the arrangement had become unanimous.

† See New Bedford Shipping-List, January 23, 1855.

‡ At the last report Newport did not have a candle factory worthy of the name.

edge to enable them to carry on the business there. In that year one of the most enterprising men of the island obtained the desired information and established a manufactory there, acquiring in the pursuit a large property. Others experimented and succeeded, and the business finally became one of very considerable importance. In 1792 ten such factories were in existence on the island.*

Probably the first candle-house in New Bedford was built very nearly cotemporaneously with that in Nantucket. According to Ricketson,† Joseph Russell erected the first one, previously to the Revolution, near the corner of Center and Front streets, employing one Captain Chaffee, who had engaged in the manufacture of spermaceti in Lisbon, to take charge of the establishment, at the extravagant salary (for the times) of $500. This building was destroyed by the British in their raid in September, 1778.

Among the exports of the colonies, including Newfoundland, Bahama, and Bermudas, in 1770 were sperm candles to the extent of 379,012 pounds, distributed as follows: To Great Britain, 4,865 pounds; to Ireland, 450 pounds; to the south of Europe, 14,167 pounds; to the West Indies, 351,625 pounds; and to Africa, 7,905 pounds. The total value of this branch of exports for that year was £23,688 4*s.* 6*d.*, sterling.

The following table from Pitkin's Statistics‡ will show the exports of sperm candles from the United States from 1791 to 1815:

Year.	Pounds.	Year.	Pounds.
1791	182,400	1803	238,034
1792	157,520	1804	127,602
1793	235,600	1805	180,535
1794	214,960	1806	294,789
1795	240,720	1807	172,132
1796	221,903	1808	45,130
1797	§130,438	1809	214,444
1798	144,149	1810	187,190
1799	240,301	1811	257,094
1800	181,321	1812	157,596
1801	290,666	1813	26,522
1802	135,627	1814	21,154

*The New Bedford Medley has, under date of Nantucket, November 30, 1792, an item to the following effect: "This day was cut from the loom the first piece of sail-cloth manufactured at the new duck factory. It employs more hands than the five rope-walks and ten sperm-candle works, 'which number there is here.'" The papers in January, 1793, reported canvas as being manufactured at Salem, Boston, and Nantucket, and another factory being about to be started at Newport, R. I. In the Mass. Col. MSS., Manufactures, pp. 295–6–7, are papers relating to the encouragement to be given by the general court to the manufacture of duck as carried on by John Powell of Boston (in 1727), and affidavits of captains of vessels the sails of which were made from canvas of Powell's make.

†Hist. New Bedford, p. 77.

‡Tables of Exports, Pitkin.

§The falling off of exports occurs chiefly in those years when European wars or national troubles make shippers cautious. In 1797 Hudson, N. Y., possessed one or more sperm-candle factories.

There are some incidents connected with this pursuit which may, perhaps, not inaptly be called the curiosities of whaling. Many of these are incorporated already in this work, and it may not be inappropriate to add a few more.

The Honolulu Commercial Advertiser in December, 1870, contained an account of a harpoon which was found in a whale captured by the ship Cornelius Howland, of New Bedford, then cruising in the North Pacific Ocean. It is the custom among whalemen to have each iron stamped with initials designating the ship to which it belongs. This is done to prevent dispute in case it is necessary to waif the whale, or in case boats from two different ships lay claim to one which has been killed. While off Point Barrow the Cornelius Howland took a large polar whale, in the blubber of which was imbedded the head of a harpoon marked "A. G.," the wound made by it having healed over. This was presumed to have belonged to the bark Ansel Gibbs, also of New Bedford. But she was known to have been pursuing the fishery in Cumberland Inlet and its vicinity for some ten or eleven years previously. The obvious inference was that this whale must have found his way from ocean to ocean by some channel unknown to navigators, and that at some seasons of the year there must be an inter-ocean communication. The Advertiser adds, "We have heard before of instances where whales have been caught at Cumberland Inlet with harpoons in them, with which they have been struck in the Arctic Ocean, but we believe this is the first authenticated instance of a whale having been caught in the Arctic Ocean with a harpoon in it from the Davis Straits side."

Quite a number of instances are on record where irons have been recovered, several years after they had been carried off by escaping whales, by parties who were in the ships to which the harpoons belonged. Thus Cheever mentions the case* of Captain Bunker, commanding the ship Howard, of New Bedford, who struck a large whale in latitude 30° 30′ north, longitude 154° east. The whale escaped, taking the iron with him. About five years after, while in the same latitude, but 14° farther west, he made fast to and succeeded in securing a noble whale. Upon cutting him up, the identical iron lost five years before proved the whale also the same.

A more singular case yet was one reported to the editors of the New Bedford Standard, in 1865, when they were shown the head of an iron thrown into a whale in the Pacific Ocean, in 1802, from a boat from the ship Lion, of Nantucket, Peter Paddack commander. In 1815, Captain Paddack, then in command of the Lady Adams, also of Nantucket, captured the same whale, and recovered his long-lost harpoon.

The Milton, of New Bedford, in 1865 or 1866 took a whale that in spouting made a shrill sound like a steam-whistle. In cutting off the head the man who put his feet into the spout-holes got one of them cut.

* The Whale and his Captors, p. 157.

Upon examination it was found that a harpoon blade was run transversely through the breathing-holes, and the whistling sound was caused by the action of the escaping air against its edge. The iron was marked with the name of the Central America, which performed her last voyage fifteen years before the capture of this whale by the Milton.*

The amount of oil obtained is not always in proportion to the size of the whale. The conditions of leanness or corpulence are quite as applicable to them as to land animals. Sperm whales which yield 100 barrels are considered very large, but this yield is occasionally exceeded. Captain Davis, in his "Nimrod of the Sea,"† says: "The largest whale we took made 107 barrels. Its length was 79 feet; from the nose to the bunch of the neck 26 feet; thence to the hump 29 feet; from hump to tail 17 feet; length of tail 7 feet; breadth of tail 16 feet 6 inches; height at forehead 11 feet; width 9 feet 6 inches; girt at fin 41 feet 6 inches; at junction of tail 7 feet 9 inches; lower jaw 16 feet long and 41 inches in circumference at thick part. It had 51 teeth, the heaviest weighing 25 ounces. Blubber on back 18 inches; on side 12 to 15 inches; and belly 9 to 10 inches. The hump was 2 feet above the level. The case made 19 barrels; body 73½ barrels; junk 14½ barrels. Captain Sullivan, of the James Arnold, of New Bedford, off New Zealand, took in one voyage 8 whales that made over 100 barrels each, the largest yielding 137 barrels. The head of this made 52 barrels, and the case baled 27 barrels. It was 90 feet long; the flukes 18 feet in length, jaw 18 feet, case 22 feet, and the forehead 13½ feet high. During the same season and on the same ground, Captain Vincent, ship Oneida, of New Bedford, took ten sperm-whales, which stowed 1,140 barrels. Captain Norton, ship Monka,‡ of New Bedford, took on the off-shore ground a sperm-whale that stowed 145 barrels."

In 1853 it is said that the ship Harvest, of Nantucket, took a sperm whale which made 156 barrels of oil, exclusive of the jaw, which was lost by bad weather.§ In 1862 the Ocmulgee, of Edgartown, reported having taken a 130-barrel sperm whale, with a jaw measuring 28 feet in length. Captain Briggs, of the bark Wave, of New Bedford, reported that on the 2d of August, 1876, he took a sperm whale which made 162 barrels and 5 gallons of oil.‖

The right whale is often taken with a much larger yield of oil, though its length of body is considerably less than that of the sperm whale. Another valuable product obtained from the right whale is the lining of the jaw, or bone.¶ This, as it usually runs, will average from 8 to 10

*New Bedford Shipping-List. Captain Hamblen, of the Andrew Hicks, of Westport, took, in 1871, from a sperm whale captured near the Gallipagos Islands an iron which belonged to the ship Catawba, of Nantucket, and had been lost 20 years previously. This was the second time Captain Hamblen had recovered a harpoon lost from the same ship—the first time the interval between loss and recovery being about 7 years.

§New Bedford Shipping-List, 1871.

‖ *Ibid.*, October 10, 1876.

¶The use of bone was unknown in 1578. At present its uses are multifarious. Mr. John K. Andrews, a whalebone-worker in Boston, kindly furnishes the following list

pounds for each barrel of oil yielded. Thus, if a ship hails 3,000 barrels of right-whale oil, the probability is that she has also obtained from 25,000 to 30,000 pounds of bone. For quite a number of years the price of whalebone was so low that but few whalemen would encumber their vessels with it, the space being of much greater value to fill with oil. When brought home it was worth but about 6 cents per pound. But the price of this commodity has been greatly enhanced. So varied and important are the uses to which it is put that it is extremely sensitive to the fluctuations caused by abundance or scarcity. Thus in the latter part of July, 1876, the price quoted was $2.05 per pound. This was already high; but by the last of October news of disaster to the Arctic fleet sent the price up to $2.50, and by the 1st of December it was quoted at $3.* "Captain Sullivan and Captain Taber, both of New Bedford," says Davis, "speak of bone of the bow-head which measured 17 feet." As whales producing such length of bone yield usually about 3,000 pounds of it, besides their proportionate supply of oil, it is apparent that one such monster is a valuable prize.

"I should like," says the author of The Nimrod of the Sea, a veteran whaleman, "to convey to the reader some idea of the dimensions of the creature from which such bone is taken. To do so is only possible by entering into the details of the various parts, with their sizes, and by comparison with objects familiar to the mind. The blubber, or blanket, of such a whale would carpet a room 22 yards long and 9 yards wide, averaging half a yard in thickness. * * * Set up a saw-log 2 feet in diameter and 20 feet in length for the ridge-pole of the room we propose to build; then raise it in the air 15 feet, and support it with pieces of timber 17 feet long, spread, say, 9 feet. This will make a room 9 feet

---

of the principal purposes to which it is put, viz: in the manufacture of whips, parasols, umbrellas, dresses, corsets, supporters of various kinds, caps, hats, suspenders, neck-stocks, canes, rosettes, cushions to billiard-tables, fishing-rods, divining-rods, bows, busks, fore-arm bows, probangs, tongue-scrapers, pen-holders, paper folders and cutters, graining-combs for painters, boot-shanks, shoe-horns, brushes, mattresses, &c.

* Page 380. Captain Davis, on p. 368, gives another description of the head of the right whale. The mouth, unlike that of his spermaceti relative, has no teeth, but instead is lined with some five or six hundred horny plates (better known as whalebone) attached to the upper jaw and extending from the throat to the end of the narrow roof. These plates are parallel, running transversely with the sides, about one-fourth of an inch apart, and terminating on the inner edge in a hairy fringe. It is these fringes that, interlacing, form the sieve or strainer through which the animal forces the water retaining within the meshes the minute food gathered as it swims along. The gullet is small; by some it is said to be too contracted to admit even a herring; but this statement Captain Davis, for obvious reasons, is not inclined to fully credit. The cavity of the mouth, when the lips are closed, exclusive of the tongue, is equal in capacity to 300 barrels, and the mass of the tongue may occupy 250 barrels, leaving about 50 barrels' capacity for a single mouthful of food-charged water. The ship Sarah Sheafe took a bow-head whale in 1857 that produced 100 barrels of oil and 3,000 pounds of bone; so it will be seen that the old formula of 10 pounds of bone to the barrel of oil does not apply to Arctic whaling. Small amounts of cut bone were sold in February, 1877, as high as $6 per pound.

wide at the bottom, 2 feet wide at the peak, and 20 feet long, and will convey an idea of the upper jaw, the saw-log and slanting supports representing the bone. * * * These walls of bone are clasped by the white, blubbery lips, which at the bottom are 4 feet thick, tapering to a blunt edge, where they fit into a rebate sunk in the upper jaw. The throat is 4 feet thick, and is mainly blubber, interpenetrated by fibrous, muscular flesh. The lips and throat of a 250-barrel whale should yield 60 barrels of oil, and, with the supporting jaw-bones, will weigh as much as twenty-five oxen of 1,000 pounds each. Attached to the throat by a broad base is the enormous tongue,* the size of which can be better conceived by the fact that 25 barrels of oil have been taken from one. Such a tongue would equal in weight ten oxen. The spread of lips, as the whale plows through the fields of 'brit,'† is about 30 feet. Sometimes in feeding the whale turns on its side, so as to lay the longer axis of the cavity of the mouth horizontally. Keeping the lower lip closed, and the upper one thrown off, and standing perpendicularly, it scoops along just under the surface, where the 'brit' is always most densely packed. After thus sifting a track of the sea 15 feet wide and a quarter of a mile in length, the water foaming through the slatted bone, and packing the mollusks upon the hair-sieve, the whale raises the lower jaw; but still keeping the lips apart, it forces the spongy tongue into the cavity of the sieve, driving the water with great force through the spaces between the bone. Then, closing the lips, it disposes of the catch, and repeats the operation until satiated. * * * The tail of such a whale is about 25 feet broad and 6 feet deep, and is considerably more forked than that of the spermaceti. The point of juncture with the body is about 4 feet in diameter, the vertebra about 15 inches; the remainder of the small being packed with rope-like tendons from the size of a finger to that of a man's leg. The great rounded joint at the base of the skull gleams like an ivory sphere, nearly as large round as a carriage-wheel. Through the greatest blood-vessels, more than a foot in diameter, surges, at each pulsation of a heart as large as a hogshead, a torrent of barrels of blood heated to 104°. The respiratory canal is over 12 inches in diameter, through which the rush of air is as noisy as the exhaust-pipe of a thousand-horse-power steam-engine; and when the fatal wound is given, torrents of clotted blood are sputtered into the air over the nauseated hunters. In conclusion, the right whale has an eye scarcely larger than a cow's, and an ear that would scarcely admit a knitting-needle."

* This tongue and throat afford the most vulnerable point of attack to the killer-whales and sharks.

† This "brit" consists of little reddish, shrimp-shaped medusæ, which occur in prodigious numbers in various parts of the ocean, where they are carried by the currents. So numerous are they that Scoresby estimates that an area of two square miles contains 23,888,000,000,000,000 individuals. These being dependent upon the action of currents for their means of locomotion, Commodore Wilkes was led to locate upon his charts those places which would necessarily become the natural feeding-grounds of the whales, and hence the localities where they would be more certainly captured.

The Boston News-Letter for March 18, 1736, mentions a whale that was "lately killed near Cape Cod," which would make its owners £1,500. This must be either a very remarkable whale, or an equally surprising inaccuracy, for it necessitates a yield of at least 2,500 pounds of bone, worth £800 per ton, and about 290 barrels of oil, worth £14 per ton. Now in 1730 oil was worth £7 per ton, and in 1748 £14 per ton, while about 1760 bone was worth in England £500 per ton. It would seem probable that the whale was very large, and that the price during that year must have run extraordinarily high, for the News-Letter appears to be usually careful in its statements.*

Capt. John Howland, in a whaling-sloop from New Bedford, while cruising in the Straits of Belleisle just previously to the Revolution, took two whales which produced 400 barrels of oil, one of them producing 212 barrels.

In 1861 the General Pike, of New Bedford, took a whale on the Kodiah ground which stowed down 274 barrels of oil. In 1855 the ship Adeline, of New Bedford, took a whale in the Ochotsk which produced 250 barrels; the result of that day's work was worth $5,000.

Naturally such immense creatures are possessed of strength; they likewise are endowed with speed and endurance. When struck they have been known, according to the Rev. Dr. Scoresby,† to descend *perpendicularly* from 4,200 to 4,800 feet, or nearly a mile. Captain Royce, who commanded the Superior in her first voyage into the Arctic, states that he has known a whale to take out 6,300 feet of line in sounding. He does not, however, mean that the whale sounded to that depth, since the line continues to be drawn from the boat even while the whale is rising, so that two-thirds of this number of feet for the perpendicular descent would probably be making a liberal estimate. The time usually occupied by whales in sounding varies from about half an hour for the right to about an hour and a half for the sperm whale.‡ A frightened whale will, according to the judgment of old whalemen, go from 10 to 12 miles an hour; indeed, when first struck they frequently rush at the rate of from 20 to 25 miles an hour for a short time. Though often killed without extraordinary difficulty, yet their tenacity of life at times

* In an editorial in the Nantucket Inquirer & Mirror of February 17, 1877, the difficulty of correctly ascertaining the yield of a single whale is commented on. In a busy season it is no uncommon thing for a ship to "boil out" a thousand or even two thousand barrels of oil without "cooling down," and unless the most extraordinary care was exercised it would be hard to tell where one whale's yield ended and another began. The Honolulu Friend, in 1849, reported a whale taken by the Junior, of New Bedford, which produced 316 barrels of oil, and the same paper is the authority for the story of a whale seen by Captain Royce of the Superior, of Sag Harbor, that was so large they would not attempt his capture, because the strain on the mast in cutting in (if he was taken) would be so great. How well authenticated this story is, is not known, but unless the authority was above suspicion, the strain on one's imagination must be as disastrous as that on the mast would have been.

† Notes on Whales and Whaling, xviii.

‡ Nimrod of the Sea, Appendix A.

is surprising. Captain Malloy, of the bark Osceola, of New Bedford, mentions an instance,* where one of his boats struck a large sperm-whale from the waist-boat. Soon after the starboard boat fastened to him and got stove; a bomb-lance was then fired into him from the waist-boat, whereupon he turned upon her and stove her, knocking the bottom completely out. The ship picked up the swimming crews, and was then steered for the whale. On seeing his new antagonist he rushed at her, striking her on the bow, knocking off the cut-water with his head, and tearing the copper and sheathing from the bow with his jaw. The ship was again put into position and run for him. As she ranged alongside two bomb and two whale lances were fired into him. A boat was then lowered and two more bomb-lances were discharged into him without effect. It was night by this time, so the boat was called aboard and arrangements were made to hold the position of the ship during the night. Occasionally the infuriated monster could be heard fighting the fragments of boats, oars, &c. "Thus through the night," continues the journal, "he held his ground, although he had two lines (600 fathoms) towing on to the harpoons, five bombs exploded in him, and other wounds from lances." The next morning the attack was renewed with bomb-lances, and *thirty-one were fired into him before he was killed.* Many similar anecdotes could be related.†

A most singular trait of the sperm-whale is what is termed by whalemen "settling." At times when suddenly alarmed it will sink bodily in the water with the apparent rapidity of a lump of lead; so rapidly, in fact, that the mortified boat-steerer hauls in the harpoon which he has thrown but which failed to hit the object thrown at. This sudden sinking is unaccompanied by any change in the horizontal position, or any motion of the tail or fins, and seems to be adopted as a means of securing safety when there seems to be no time to round out and sound.‡

Another singular feature connected with the whale-fishery is the sudden coming and going of the objects of pursuit. According to Davis,§ their appearance and disappearance would seem somewhat periodical, as though perhaps certain phases of the moon were better than others for the prosecution of the fishery. At such times whales suddenly ap-

* *Ibid.*, p. 233.

† Scoresby (ii, p. 276) relates an instance in the experience of the English whaleship Resolution, where a whale was finally killed after a chase of nine miles, and after having carried off one boat (which was lost) and 10,440 yards or nearly six miles of line.

‡ P. 187. The thorough descriptions of whales, their habits, haunts, &c., given by Scammon and Davis, make extended comments unnecessary in this work.

§ P. 177. Schools of whales containing many individuals have, even within a comparatively late period, been seen and attacked in the Indian Ocean. The fishery there extends from Cape Leeurvin to Java Head, a distance of 1,600 miles. In 1838 the American and French whalemen took at one capture off Cape Leeurvin 10,000 barrels; in 1845 the Americans in one onslaught in Champion Bay took 6,000 barrels; in 1857 the American and French fleets, while off King George's Sound, took at one time 12,000 barrels.

pear and are plenty, and this season will be followed by a period in which none will be in sight.

In 1868 there appeared in the Flag of our Union a series of sketches entitled "Leaves from the Arethusa's Log," by William H. Macy, esq., a veteran whaleman. Among them was one detailing the "raising," pursuit, and capture of a sperm-whale.* Being a life-like description of this event as it ordinarily occurs, it is, with the author's permission, transferred to this work:

"The next morning, having the first mast-head, I was in the foretop-gallant cross-trees at sunrise, thinking, of course, of the five-dollars' bounty all the way up the rigging.† The him outline of the peak was still visible, and the topsails of the Pandora just in sight, astern, the wind still continuing moderate at west-northwest, both ships steering south by west. As I looked astern, when I *first* got my footing aloft I caught sight of something like a small puff of steam or white smoke, rising a little and blowing off on the water. Looking intently at the same spot, after a short interval another puff rose like the former, satisfying me, from the descriptions I had heard, that some sort of whale was there, and I instinctively shouted, 'There she blows!'

"Where away?" hailed Mr. Johnson, who was just climbing the main-topmast rigging; "O, yes, I see him! sperm whale, I believe—hold on a bit till he blows again—yes—thar 'sh' blo-o-ows! large sperm whale! two points off the larboard! Blo-o-ows! headed to windward!"

"How far off?" shouted Mr. Grafton from the deck.

"Three miles! 'ere sh' blows!"

By this time the old man‡ was on deck and ready for action. "Call all hands out, Mr. Grafton! Hard a starboard there! Stand by to brace round the yards. Cook! get your breakfast down as fast as you can. Keep the run of him, there, aloft! Maintop bowline, boat-steerers! Sure it's a sperm whale, eh, Mr. Johnson? Steward! give me up the glass—I must make a cleet in the gangway for that glass soon. Muster 'em all up, Mr. Grafton, and get the lines in as fast as you can (mounting the shearpole). Sing out when we head right, Mr. Johnson! Mr. Grafton, you'll have to brace sharp up, I guess (just going over the maintop). See the Pandora, there? O, yes, I see her (half-way up the topmast-rigging). Confound him! he's heading just right to see the whale, too! ("There goes flukes!" shouted the mulatto.) Yes! yes! I see him—just in time to see him (swinging his leg over the topmast cross-trees), a noble fan, too! a buster! Haul aboard that maintack! We must have that fellow, Mr. Johnson. Steady-y! Keep her along just full and by. *We mustn't let the Pandora get him, either!*"

The Arethusa bent gracefully to the breeze, as, braced sharp on the port tack, she darted through the water as though instinctively snuffing

* "The First Whale." The series is soon to be published in book-form.

† It is sometimes the custom on whalemen for the captain to offer some reward to the man who first "raised" or discovered whales.

‡ The term applied by the sailors to the captain.

her prey. The whale was one of those patriarchal old bulls, who are often found alone, and would probably stay down more than an hour before he would be seen again. Meantime, the two ships were rapidly nearing each other; and the Pandora's lookouts were not long in discovering that "something was up," as was evinced by her setting the main royal and foretopmast studding-sail, though they could not possibly have seen the whale yet. But the whale was apparently working slowly to windward, and the Pandora coming with a flowing sheet, all of which was much in her favor. The old man remained aloft, anxiously waiting the next rising, from time to time hailing the deck to know "what time it was?" and satisfying himself that the boats were in readiness, and breakfast served out to those who wanted it. As three-quarters of an hour passed, he grew more anxious and fidgety, shifting his legs about in the cross-trees and clutching the spy-glass in his nervous grasp.

"Are you all ready, Mr. Grafton?"

"Ay, ay, sir," answered the mate from the maintop, where he had mounted to get a look at the whale when he should rise again.

"Let them hoist and swing the boats."

"Ay, ay, sir."

"I think I saw a ripple then," said the second mate, from the topsail yard directly beneath him.

"Where?" demanded the captain.

"Four points off the lee bow."

"O! no, you didn't, he won't come there. He'll rise right ahead or a little on the weather bow. I don't think he'll go to windward—Good gracious! see that Pandora come down! She'll be right in the suds here directly! I think we've run far enough, eh, Mr. Grafton? Haul the mainsail up, then! and square the main-yard!"

Silence for a few minutes after this evolution was performed.

"He can't be far off when he comes up again. Look at the men old Worth has got aloft there, his cross-trees swarming, and every rattlin manned. Look sharp! all of ye! We must see that whale when he first breaks water. That helm eased down? Haul the foresail up! and let the jib-sheets flow a little more. It can't be possible that the whale has been up—no, we couldn't help seeing him, some of us—I *know* 'twas a sperm whale. I saw his fan; besides, there's Mr. Johnson—best eyes in the ship. What time is it there? An hour and ten minutes that whale has been down—a long-winded old dog! We shall have to wear around, I'm afraid we shall forge. Blo-o-ows! right ahead, not one mile off! Down, there, and lower away! Now, Mr. Grafton, work carefully—Mr. Dunham, too; if you don't strike this rising, spread your chances well, and don't crowd each other—*but don't you let the Pandora get him!*" The captain was by this time in the stern of his own boat. "All ready, Mr. Johnson? Where's Old Jeff.* at my midship oar? O, here you are, eh?

* Every man has his place.

You ain't turned white yet—lower away! Cooper! Where's Cooper?* As soon as we are clear, wear round—*let run that davit fall!*—wear round and make a short board—haul up your tackle, boy. Keep to windward all you can, Cooper! Pull a little off the weather bow, Mr. Grafton, and then set your sail! Haul in these gripes towing over the quarter. By thunder, there's Worth's boats all down! coming with a fair wind, too! Out oars, lads."

The Pandora had luffed to, and dropped her boats a mile to windward, and they were coming down before the breeze, wing-and-wing, with their paddles flashing in the sunlight, and their immense jibs guyed out on the bow-oar as studding-sails, promising to stand about an equal chance for the whale with ourselves. The larboard boat, to which I belonged, proved the fastest of the three, and had a little the lead. After pulling a few quiet strokes to windward, Father Grafton set his sails, and, as he gave the order to "peak the oars and take the paddles," seemed as cool and calm as when engaged in the most ordinary duty on board. There was no confusion or bustle in his boat, but, with his practiced eye fixed upon the huge spermaceti, he kept encouraging us in a low, dry tone, as he conned the steering-oar with such skill that he seemed to do it without effort.†

---

* Usually the cooper is also head ship-keeper while the boats are down, if the captain is in one.

† Exciting scenes have often occurred where boats from rival ships contended for the prize, which by the law of whaling belongs to the first "fast" boat. Many years ago an English, a French, a Portuguese, and an American ship lay becalmed within a radius of a mile of each other in the South Pacific, when a whale was "raised." With a celerity peculiar to whaling, a boat from each ship was down and in pursuit. The American whaleman is the only man who attends exclusively to his own duty; the oarsmen leave it to their officers to watch the whale and only attend to getting the boat through the water. Says the boat-steerer of the American boat in his account of the race: "Placing the palm of my left hand under the abaft oar, while with my right I guided the boat, and at each stroke threw a part of my weight against it, our boat would 'skim the water like a thing of life.' A few moments from the start brought us up with the Portuguese. The crews of the different ships witnessing the chase, the excitement was tremendous. Our shipmates cheered us as we came up with the first boat, and as we passed, the whale again made its appearance. Singing out to the men, 'There she blows! She's an eighty-barrel—right ahead. Give way, my boys!' &c., we were soon alongside the Frenchman. The Frenchman was too polite to oppose us, and we passed him with ease. The English boat was now about ten rods in advance, and the whale about one and three-fourths of a mile. Now came the trial. The English boat was manned by the same number of stout, active hands as our own, and, seeing us pass the other boats, their whole strength and force was put to the oar. We gained on them but slowly, and such was the excitement of the race that we were in danger of passing over where the whale had last 'blowed.' At this moment the English boat-steerer noticed the manner in which I had placed my left hand and weight against the oar. Instantly laying hold of his own in a like manner, his first effort broke it short at the lock. Thus disabled, he gave us a hearty curse as we shot past him like a meteor. We had been so excited with the race that we had lost sight of the whale. As luck would have it, at this instant she 'blowed' but a few rods ahead. In a moment we were fast, and 'all hands stern.' * * * That whale stowed us down

"Now, lads, you face round to paddle, you can all see him. I declare, he's a noble fellow—ninety barrels under his hide if there's a drop. Bunker, do you see that fellow? he's got a back like a ten-acre lot—paddle hard, lads,—if you miss him, go right overboard yourself, and don't come up again—long and strong stroke, boys, on your paddles. See that boat coming—that's Ray, the second-mate of the Pandora—three or four more spouts, and we'll have him—he's ours, sure! they can't get here in time—scratch hard, boys! don't hit your paddles on the gunwale. Stand up, Bunker, and get your jib-tack clear! Don't let them gally* you, if they shout in that boat."

"All right!" said his boat-steerer, with his eager hand resting on the iron pole, "Never fear, sir."

"Paddle hard, lads, a stroke or two. That's right, Bunker. Keep cool, my boy, keep cool, and make sure of him."

A wild and prolonged shout rang on the air from six sturdy pairs of lungs in the Pandora's waist-boat, as Mr. Ray, seeing that he was baffled, let fly his sheets and rounded to, a ship's length to windward. It was too late, however.

"All right," said Father Grafton, in the same dry, quiet tone, as before. "Hold your hand, Bunker. Hold your hand, boy, till you're past his hump—another shoot, lads—way enough, in paddles. Now, Bunker, give it to him. Down to your oars, the rest. Give him t'other one, boy! Well done! both irons to the hitches.† Hold water, all. Bear a hand, now, and roll up that sail. Wet line, Tom! wet line! Where's your bucket? All ready with your sail, Bunker? Let her come, then—all right. Come aft here, now, and let me get a dig at him."

The line was spinning round the loggerhead with a whizzing noise, and a smoking heat, as the huge leviathan, stung to the quick, darted down into the depths of the ocean. Bunker threw on the second round turn to check him, and jamming the bight of the line over the stern-

---

eighty-five barrels of oil, and shortened our voyage two months." (See The Whale and his Captors, p. 196.)

Another international race took place once in Delago Bay. A large whale was "raised" at the same moment by an English and an American ship, about equidistant from each, and immediately the boats were down. The English, having the lead, finding the American gaining, bore wide from the whale to throw their rivals on the outside. When, however, they both came, side by side, abreast of the whale, the English inside, of course, one of the American sailors sprang from his seat and darted his harpoon directly over the English boat, planting it clear to the socket in the whale's life, and the Englishmen, hastily releasing themselves from their perilous position, left the field to their American cousins, while the shores of Delago Bay echoed with the cheers of the comrades of the victors. (N. A. Review, 1834.)

*Mr. Macy thinks this word may be a corruption of the obsolete verb *gallow*, to be found in old writers. Thus Shakespeare says, in King Lear, "The wrathful skies gallow the deep wanderers of the dark."

†It sometimes happens that as the iron is thrown, the whale "bows," and the harpoon striking in the concave against what is called "slack blubber" fails to penetrate. (See Nimrod of the Sea, p. 378.)

sheets, watched it carefully as it flew through his grasp; while the mate cleared his lance, and got ready to renew the attack. Every moment his anxiety increased as he kept turning his head, and looking at the tub of line, rapidly settling, as the whale ran it out, "I declare, I believe he'll take all my line. Blacksmith! pass along the drug!* Check him hard, Bunker!" then, seeing the other boats near at hand, he opened his throat, and, for the first time, we learned the power of Father Grafton's lungs.

"Spring hard, Mr. Dunham! I want your line! Cast off your craft, and stand by to throw your line to me! Spring hard! *Do!*"

The ash sticks in the waist-boat were doing their best, as the loud "Ay, ay!" was borne back o'er the water from Dunham, while the old man could be seen in the rear of the picture wildly straining every nerve to be "in at the death," and heaving desperately at the after oar, with his hat off, his hair flying loosely in the breeze, and his whole frame writhing with eager excitement. Our line was going, going; already there was but one flake in the tub, when the waist-boat ranged up on our quarter, and Fisher, with the coil gathered in his hand, whirled it over his head, making ready for a cast.† At this instant his strain was suddenly relieved, and the line slacked up.

"Never mind!" roared Mr. Grafton. "Hold on, Fisher. All right, he's coming. Never mind your line, Mr. Dunham, he's coming up! Pull ahead and get fast! Get a lance at him if you can! Haul line, *us!* Face round here all of ye, and haul line! Careful, Bunker, about coiling down.‡ He'll be up now, in a minute; haul lively!"

The waist-boat had shot ahead under a fresh impulse of her own, and the captain came drawing up abreast of the fast boat.

"Are you well fast, Mr. Grafton?" "Ay, ay, sir; both irons chock to the socket." "That's the talk. Got 'most all your line, hasn't he?" "Yes, sir." "Well, gather in as fast as you can. Spring hard, *us!* Spring! I want to grease a lance in that fish. There he is; up," he shouted, as the tortured monster broke water, showing his whole head out in his agony, and started to windward.

Fisher had bent on his craft again, and was about two ship's lengths from the whale when he rose.

"Haul quick, my lads," said the mate, "and get this stray line in. There's Mr. Dunham going on, and the old man will be with him in a minute. There he brings to!" as the whale suddenly stopped short in his mad career, and lay swashing up and down, as if rallying his strength for a fresh effort.

---

*Drag.

†In taking the second boat's line the upper end is made fast to the lower end of the line of the "fast" boat, which then becomes the "loose" one, and the second boat takes the place of the first.

‡In hauling in the line from a fast whale it is not recoiled in the tub, but in the boat. The utmost care is, however, necessary in this coiling, for if occasion demands it must run out as freely the second time as from the tub.

"There 's 'stand up' in the waist-boat! There he darts! Hurrah! two boats fast. Haul lively, *us*, and get this line in!"

His whaleship seemed staggered by this accumulation of cold iron in his system, and lay wallowing in the trough of the waves. It was a critical moment for him; for Mr. Dunham was getting his lance on the half-cock, ready for darting, and as the whale suddenly "milled short round" to pass across the head of his boat, the young man saw his advantage, and cried, "Pull ahead! Pull ahead,* and we'll get a 'set' on him! Lay forward, Fisher! Lay forward hard, my lad! right on for his fin! Pull ahead! So, way enough—hold water, all;" and, driven by a strong arm, the sharp lance entered his "life," its bright shank disappearing till the pole brought it up.

"Hold her so!" said the second mate. "Way enough! just hold her so till he rises again!" as the whale hollowed his back under the sea, now crimsoned with his life-tide, and again rising, received the lance anew in his vitals; but the first "set" was enough, and the gush of clotted blood from his spiracle told how effectually it had done its work.

"There," said Father Grafton, who had just got his line gathered in and was ready to renew the assault, "there's the red flag flying at his nose. Blacksmith, we may as well put up our lance, we sha'n't want it to-day. Well done, Mr. Dunham. Thick as tar the first lance. Hold on line, Bunker! heave on a turn!" as the whale, making a dying effort, started up to windward, passing among the Pandora's boats within easy hail.

"Give us your warp, Pitman, if you want a tow," said Bunker, in passing, to Mr. Ray's boat-steerer.

"Every dog has his day," growled Pitman in reply.

---

* It sometimes happens that it is desirable to draw up alongside the whale while fast to him, the more effectually to use the lance. This operation is thus described: "Having hauled as well forward as the position of the harpoon will admit, the boat-header reaches over the bows, and, taking hold of the line forward of the *chocks*, brings it around outside the boat, then giving it into the hands of the bow-oarsman, who has faced forward on his thwart. Now, as the man hauls on the line, the direction of strain is oblique, well back on the bow, and the course of the boat becomes parallel with that of the whale a few feet distance from him. The boat-header then has his chance to ply the lance with deadly effect. If the harpoon is well forward of the hump of the whale, the boat will run in comparative safety, as the strokes of the tail will be behind the boat, and the swing of the jaw in front. As long as the whale continues running in a straight course on the surface, the persistent boat will cling behind his fin as a bull-dog will to the nose of an ox. His only escape is to run deep, or, by suddenly *milling* or turning, to bring the boat in reach of jaws or flukes. The duty of the bow-oarsman is arduous when the whale is running fast, or there is a high sea. By his own strength he must keep the boat in its position, though drenched with the flying spray from the bow. Should the strain wrench the wet line through his burned hands, the blessings of the excited boat-header are poured on his head with a vigor heard only in the rushing hiss of this 'Nantucket sleigh-ride.'" (Nimrod of the Sea, p. 142.)

"Yes. Come aboard to-morrow; I'll give you a scrap for luck."

The whale went in his flurry* and turned up nearly under the stern of the Pandora, as she luffed to for her boats; but Captain Worth could not afford to lose the breeze long, and, by the time the last boat was on the cranes, his helm was up and his mizzen-topsail shivering. The old ship fell off to her former course, and, setting her royal and studding sails, left her more fortunate consort "alone in her glory."

H.—INTRODUCTORY TO RETURNS.

In making up these reports many difficulties occur.

1st. In the earlier years, in fact down to about the years 1844–'45, the reports of the amount of bone taken were only occasional. Most of that commodity was imported prior to 1840 in New London and Sag Harbor ships, its value being so low that captains of vessels from many of the other ports did not care to be encumbered with it. For this reason a large amount of bone was brought home which it is impossible to properly accredit.

2d. Oil and bone were frequently sold by vessels in foreign ports to pay for repairs, of which no account appears.

3d. Much oil and bone came home as freight which was not recorded in the shipping journals, and hence does not appear in the record. In many cases where it was recorded the return was made in the name of some shipping agent and not of the vessel. Where one man or one firm acted as agent for from two to ten ships proper credit was impossible. Again, many cases occur where two and occasional cases where even three vessels of the same name sail from the same port. Where a credit to them is made, it must be made, unless the vessel is carefully specified, according to the best judgment of the compiler.

4th. Oil is sent home in casks and bone in bundles, and in many cases is returned in that form. Now casks hold from two to eight barrels, and bundles of bone are of various sizes. The estimate in such cases has been founded on 4½ barrels to the cask, and 90 pounds to the bundle.

Abbreviations used: A. O. or Atl., Atlantic Ocean; C. G. H., Cape of Good Hope; P. or P. O., Pacific Ocean; Brazil, B. B., or B. Banks, Brazil Banks; Woolwich, Woolwich Bay; Falk., Falkland Islands; W. I., W. Ind. or West Ind., West Indies; Peru or Chili, coast of Peru or coast

* The head rises and falls, and the flukes strike the surface in rapid succession. With great force it will rapidly swim in a large circle, sometimes passing two or three times around, and then closing the circuit by rolling on its side, dead. This is termed the "flurry," and the ending of the tragedy is "fin out." (Nimrod of the Sea, p. 177.) The food of the sperm whale consists principally of squid, and in the agonies of his "flurry" he often throws up immense pieces of undigested food, pieces half as large as a whale-boat are frequently seen, and these seem to be mere fragments of the immense marine monster to which they formerly belonged. Mr. Joseph Swain, of Nantucket, relates an instance where a piece of shark several feet long was similarly vomited up in the death-struggle of a sperm whale.

of Chili; S. A. or S. Atl., South Atlantic; Africa, coast of Africa; S. S. or S. Seas, South Seas; Pat., coast of Patagonia; South Coast, along the edge of the Gulf Stream; Delago, Delago Bay; W. Ilds., West. Ilds., or C. de V., Cape de Verdes or Western Islands; East coast or East shore, that part of the African coast; Shoals, Nantucket Shoals; Guinea or Japan, the coasts of those countries; N. W., Northwest coast of America; N. P., North Pacific; S. P., South Pacific; Ind., Indian Ocean; N. Z., New Zealand; Des., Desolation Islands; Cum. In., Cumberland Inlet; Hud. Bay, Hudson Bay.

I.—RETURNS OF WHALING-VESSELS, SAILING FROM AMERICAN PORTS, SINCE THE YEAR 1715.

1715.

Six sloops sailed from Nantucket of from 30 to 40 tons burden each, returning with cargoes amounting to 600 barrels of oil and 11,000 pounds of bone, and valued at £1,100 sterling. This number was probably for some years pretty constant.*

1722.

In 1722, the sloop ———, of Nantucket, Elisha Coffin master, was lost at sea with all on board.

1723.

Among the vessels sailing this year was one from Rhode Island, commanded by William Bennett, and a sloop from Nantucket, commanded by Nathan Skiff. Bennett brought into Rhode Island the largest sperm whale ever seen in Rhode Island up to that date (May, 1723). He obtained from it 18 barrels of head matter and from 40 to 50 barrels of body oil, and reported that he might have obtained one-third more from the head if the weather had been favorable. The account concludes: "This spring our vessels have brought eight whales into this port."† The sloop reported from Nantucket was captured by the pirate Low, her captain killed, two Indians carried away, and the balance of the crew sent adrift in the two boats with no sustenance save water. They arrived safely in Nantucket, however.‡

1730.

Twenty-five vessels, from 38 to 50 tons burden each, sailed from Nantucket and obtained 3,700 barrels of oil, valued at £7 per ton, £3,200.

1731.

Among the vessels sailing this year was a sloop from Nantucket, of which Thomas Hathaway was commander, and which was lost with all on board. The sloop Pelican, of Newport, Benjamin Thurston, owner, made a voyage, returning with 114 barrels oil, 200 pounds bone.

1732.

A vessel, commanded by a Captain Atkins, made a whaling-voyage to Davis's Straits, going as far as 66° north. This was probably the first voyage to this locality from the Colonies.

* It must be remembered that these lists, up to the year 1815, are entirely made up from newspaper reports and sundry scraps of information gathered here and there.

† Boston News-Letter.

‡ *Ibid.*

1733.

Lot Thatcher, son of Major Thatcher, of Barnstable, was drowned while on a whaling-voyage, probably in a Barnstable vessel. A whale was taken in the Bay of Fundy by a Captain Hussey, and brought into Boston in August.

1736.

In March whaling-vessels commanded by the following men cleared from the port of Boston:* James Smalley and Daniel Smalley (for Greenland). In April, Doty, Doane & Mayo (for Greenland); Jenkins, Myrick, Doane, Langstaff, Lombard, Dimock, Rider, Doane, and Davis (Davis's Straits). In May, Yeates (Davis's Straits). In August, a whaling-schooner arrived at Nantucket from the northward with three large whales, one of them "twelve-foot bone."† In the same month Captain Langstaff returned from Davis's Straits to Cape Cod. While in the straits he struck a large whale which stove his boat, breaking an arm and a leg (in two places) of one of the crew, and injuring less seriously four others. A day or two after they fell in with a Dutch ship which had a surgeon on board, who set the broken bones and dressed the wounds. Captain Langstaff took two whales besides this troublesome one, one before, and the other after the accident. In September, Dimock, Barker, Dimock (No. 2), Myrick, Jenkins, Lombard, and Langstaff (No. 2), arrived home.

1737.

In February there cleared from the port of Boston for Davis's Straits, Rider & Webster. In March, Rider (No. 2), Adams, Doane, Lombard, Mayo, Crowell, Davis, Strout, Crawford, Glargon, Smalley, Doty, Freeman, and Mayo (No. 2). In April, Dimock, Bangs, Taylor, Gorham, Somes, Daniel Gorham, West, Doane, (No. 2), Paddock, Snow, White, Underwood, Smith, Small, Vickery, Small (No. 2), Higgins, Vickery (No. 2), Bickford, and Smith (No. 2)‡. In May, Black, Rust, Cudworth, and Oakley—in all 40.

Captain Atherton Hough arrived at Eastham from a whaling-voyage to Davis's Straits in August. There also entered at Boston from the same locality—in August, Captains Paddock, Smalley, Isaac Smalley, Somes, and Smith; in September, Clift, Mayo, Lombard, Watts, Doty, Robert Mayo, Vickery, Bickford, Bayly,§ Haugh, Mayo, Gorum, Bacon, Snow, Russell, Oakley, Taylor, and Dimock; in October, Hussey and White. (The Davis's Straits fleet from Massachusetts alone in this year must have consisted of between 50 and 60 vessels.)

* Boston was the port of entry for nearly the whole State. Vessels from Dartmouth and vicinity usually cleared from and entered at Newport, and Nantucket vessels, before that port was made one of entry, cleared sometimes from Newport and sometimes from Boston. The names of captains and not of vessels are given.

† Referring to the length of the slabs.

‡ A dozen whaling-vessels, says the Boston News-Letter, are fitting for Davis Straits from Provincetown (1737). "So many people are going that not over a dozen or fourteen men will be left."

§ The spelling is as per report.

1738.

Cleared from Boston for Davis's Straits in March, Stephen Snow, Prince Snow, John Gorham, Benjamin Gorham, Strout, Elisha Mayo, Robert Mayo, John Smalley, Elisha Smalley, Doane, and Hatch; in April, White and Howland.

Entered at Boston from Davis's Straits, in August, Mayo, White, and Smalley; in September, Smalley (No. 2); in November, Bennett and Gorham. The Davis's Straits fishery yielded excellent returns.

Joseph Chase also made a whaling voyage from Martha's Vineyard in the sloop Diamond, 40 tons burden.

1739.

Cleared at Boston in April for Davis's Straits, Captain White. Entered at Boston from Davis's Straits, Small, Robbins, Doty, Mayo, White, and Smalley (August), Sears (September), and Gorham (November).* James Claghorn in the sloop Leopard (40 tons), and Jos. Chase in the sloop Diamond, also made whaling-voyages from Martha's Vineyard.

1740.

Cleared at Boston in March for Davis's Straits, Mayo. Sailed from Martha's Vineyard, sloop Leopard, Claghorn master. A whaleman on the Banks having lowered for whales, his boat was attacked by a sperm whale and stove into kindling-wood. The crew were rescued unharmed, by another boat, to which also the whale immediately gave chase, but by dint of hard rowing the fate of its predecessor was avoided.

1741.

The sloop ———, Capt. Solomon Sturgis, sailed from Barnstable, whaling. The sloop was captured by a Spanish privateer under command of Don Francisco Lewis. Sturgis and eight of his men were allowed to leave, and the vessel with four men was carried away. The sloop Leopard, Claghorn, made another voyage from Martha's Vineyard.

1742.

Sloop Humbird, John Harper master, made a voyage from Martha's Vineyard. Sloop ———, Daniel Paddack master, sailed from Nantucket and was lost.

1744.

A whaleman from Nantucket was captured by a French privateer. Sloop Susannah, 55 tons burden, made a voyage from Martha's Vineyard.

* At this very time the English papers were remarking the success of the Dutch in the Greenland fishery, and saying, "It is surprising that such Instances of the prodigious Advantage of the Greenland Fishery should not push the English to more vigorously pursue it." See item in Boston News-Letter, dated Newcastle, July 23.

1746.

A whaling-vessel, presumably from Martha's Vineyard, was taken by a French man-of-war near Newfoundland,* and a sloop from Nantucket was taken by a French privateer, released and subsequently captured by a Spanish privateer and put in charge of a prize crew, who being unable to navigate her, turned her over to the prisoners and by them she was carried into Philadelphia.

1747.

Among the whaling-fleet of this year there sailed a schooner from Boston, ———, Mayo master, and a sloop from Nantucket, Peter Bunker master. These two vessels were captured by a Spanish privateer off the Capes of Virginia. The sloop was ransomed for $800 and a brother of the captain was detained by the Spaniard as security.

1748.

Sixty vessels, of from 50 to 75 tons burden each, sailed from Nantucket, returning with 11,250 barrels of oil, valued at £14 per ton, £19,684.

1750.

In August Captain Atkins entered at Boston from Davis's Straits.

1751.

Sloop Experiment made a whaling voyage from Williamsburg, Va., along the coast, returning early in May with a valuable whale.

1752.

A vessel of 75 tons burden, owned by John Newman and Timothy Coffin, of Martha's Vineyard, made a whaling voyage; also one of 55 tons owned by John Norton, esq., and others of the same place, made another.

1753.

The two vessels which sailed from Martha's Vineyard last year sailed again this. The former, which was commanded by Coffin himself, was captured off the Grand Banks by a French vessel and Coffin was killed. The latter, under the command of Christopher Beette, was lost on the coast of Carolina.

1754.

Two whalemen off the Capes of Virginia were struck by lightning, and two men killed on board one of them.

1755.

Three sloops from Nantucket, commanded respectively by John Starbuck, Jonathan Coffin, and Peter Bunker, were lost while whaling.

* The Boston News-Letter of February 26, 1746, says: Two men arrived at Martinico who were whaling near Newfoundland, and were taken by a French man-of-war and carried to Chebueta, thence sent to Canada.

1756.

Eighty vessels, of an average of 75 tons burden, pursued the business from Nantucket this year. Of these, three, commanded respectively by Christopher Coffin, Peleg Coffin 2d, and Nathan Daggett, were lost, and six others, under Captains Henry Coffin, Jonathan Coffin 2d, Seth Hussey, Nathaniel Coleman 2d, William Barnard, and Josiah Gorham, were captured by the French. (One of those captured was said to have had 600 barrels of oil on board.) The returning vessels brought in 12,000 barrels of oil, valued at £18 per ton, £27,600. In September, Captain Smith entered at Boston from Davis Straits.

1757.

Capt. Nathaniel Woodbury, in a whaling-sloop from Nantucket, was captured by the French privateer Revenge, about the middle of August, east of the Grand Bank. He had no oil on board at the time, and his vessel was restored to him with the warning that another privateer was cruising in that vicinity. Woodbury immediately made the best of his way to Nantucket, arriving there early in September.

1758.

Two whaling-sloops were captured this year by a privateer brig from Mississippi, and the sloop Industry, Isaiah Eldredge, master,* was captured by a French privateer.

1760.

A whaling-vessel from Nantucket was captured by a French privateer sloop of 12 guns, but released after the Frenchman had put on board of her the crew of sloop ———, Luce master, which they had taken full of oil a few days before, and burned. Another privateer, mounting 14 guns, took several whalemen; one of them was ransomed for $400, and the crews of all put on board of her and landed at Newport. Sloop Polly (65 tons), of Martha's Vineyard, owned by John Norton, esq. and others, made a voyage from that port. The sloops Goodluck, Dolphin, and Success, owned by Jos. Conkling, John Foster, and others, are said to have sailed from Sag Harbor, in this pursuit, to Disco Island.

1761.

Ten vessels, of from 70 to 90 tons burden each, cleared from Massachusetts for the St. Lawrence fishery. Names of captains engaged in the fishery, so far as are now known,† John Clasby, Seth Folger, ——— Jenkins, ——— Dunham, ——— Allen, ——— Pease, Thomas Gibbs, John Akin, Ephraim Delano, Thomas Nye, ——— Shearman.

* Probably from Dartmouth.

† From the log of the Betsey. See Ricketson's History of New Bedford.

1762.

Seventy-eight vessels cleared this year for the whaling-grounds. Of these 50 went to the Gulf of St. Lawrence. The produce of the fishery was 9,440 barrels of oil, valued at $102,518.40. A schooner, ——— Bickford master, was lost on Seal Islands. The sloop Polly, from Martha's Vineyard, was lost while whaling at the southward, and her crew of thirteen men perished with her. A sloop from Nantucket was taken by a privateer while whaling near the Gulf Stream. Among the captains who sailed were, Shubael Bunker, Benjamin Paddock, Henry Folger, and Nathan Coffin.

1763.

More than 80 vessels sailed this year from Massachusetts for the Gulf of St. Lawrence.

1764.

Seventy-two vessels sailed this year, returning with 11,983 barrels of oil, valued at $131,135.38. One of these vessels was commanded by Jonathan Negers, of Dartmouth. While fast to one whale the boat which Captain Negers headed was struck by a second, and the captain received injuries from which he died a few days after. A brig from Nantucket, Solomon Gardner, master, was lost.

1765.

One hundred and one vessels sailed in 1765, and the produce was 11,512 barrels of oil, valued at $125,020.32. A new whaling-sloop from Dartmouth was run down and sunk by another whaleman from the same port. The majority of the vessels fished in the Gulf of St. Lawrence and Straits of Belleisle.

1766.

One hundred and eighteen vessels, of an average of 75 tons each, went whaling from Nantucket, producing 11,969 barrels of oil, valued at $129,983.24. Captain Peter Wells arrived at Boston, August 18, and between September 25 and October 2 quite a number of whalemen arrived at the same port. From one of them the son of the captain (Clark) was lost while striking a sperm-whale off George's Banks. Several vessels also sailed from Warren, R. I., most of them going southward, and one of them from the Western Islands, bringing in over 300 barrels of oil. Newport sent some vessels too.

1767.

Nantucket sent 108 vessels, averaging 75 tons each, producing 16,561 barrels of oil, worth $179,852.46. Two sloops, one commanded by Captain Coleman and the other by Captain Coffin, both of Nantucket, were lost in the Straits of Belleisle.

1768.

The fleet from Nantucket consisted of 125 vessels, of an average of 75 tons, returning with 15,439 barrels of oil, worth $167,667.54.* (In addition to these a large number of vessels sailed from Boston, Cape Cod, Dartmouth, Providence, Warren, Newport, and other ports.) One sloop sailed from New York in April. The names of the captains of vessels in the northern fishery, so far as can be ascertained, are as follows: Joseph Tripp, Benjamin Jenney, Salathiel Eldridge, Isaiah Eldridge, and Fortunatus Sherman, of Dartmouth; Phineas Fish and Nathaniel Allen, of Falmouth; ——— White, of Cape Cod; Dillingham and Peter Welding, of Boston; and Louis Taber, Gamaliel Spooner, Thomas Paine, Jeguthan Hammond, Benjamin Young, John Howland, Daniel Hussey, ——— Nye, ——— Meader, Nathaniel Delano, Ephraim Delano, William Russell, Elisha Cushman, Christopher Hopkins, David Snow, Elijah Crocker, John Akin, Daniel Ricketson, John Howland, Seth Folger, Abishai Folger, Shubael Weeks, Alexander Gardner, ——— Butler, ——— Luce, ——— Batty, ——— Clarke, John Clasby, ——— Anthony, George Smith, Solomon Hatch, and Benjamin Barnard.

1769.

One hundred and nineteen vessels engaged in whaling from Nantucket, producing 19,140 barrels of oil, valued at $462,996.60. The names of the captains commanding in the northern fleet, so far as can be ascertained, are Isaiah Eldridge, ——— Delano, Joseph Tripp, James Coffin, Melatiah Pease, Lemuel Jenkins, Benjamin Dillingham, Fortunatus Sherman, and Thomas Marshall, of Dartmouth; Joseph Coleman, Nathaniel Coleman, Seth Coleman, William Long, Benjamin Chase, Jonathan Coffin, Solomon Folger, Benjamin Jenkins, John Woodbury, Matthew Barnard, and Joseph Gardner, of Nantucket; Edmund Conkling, Joseph Conkling, and John Squires, Long Island; Richard Whelden, Rufus Fish, Barachian Bassett, and Shubael Weeks, Falmouth; Samuel Whippey, New York; Gilbert Nash and Thomas White, Boston; Silas Snow and Joshua Harding, Cape Cod; and Benjamin Stratton, of Sandwich. In addition to the foregoing, Captains Butler, Wass, Strange, Sears, Pease, Coffin, Norton, Edmonds, Wheldon, and Daggett sailed from Providence, most of them sailing to the southward; Captain Grinnell sailed from Warren; and Capt. William Reade made a voyage in sloop Hampton, from Newport to the Western Islands grounds, obtaining 130 barrels of oil.†

1770.

Nantucket sent 125 vessels, of an average of 93 tons each, to both the northern and southern whaling-grounds; the produce being 14,331 barrels of oil, valued at $358,200. Probably fully as many more sailed from

* The Boston News-Letter, in its dispatches from New York, under date of April 20, 1768, says, "it is understood that the people of the island of Nantucket alone took oil and bone last season to the value of £70,000."

† Captain Strange took 200 barrels. Probably the total yield *exclusive of Nantucke* would exceed 6,000 barrels.

all the other ports combined, and probably the yield was about the same. Among the captains were the following, sailing most of them to Davis Straits and the Straits of Belleisle: Isaiah Eldredge (in sloop Tryall), ——— Delano, Seth Hamblin, Lazarus Spooner, Fortunatus Sherman, ——— Dillingham, and Joseph Tripp, of Dartmouth; James Fitch, Abishai Folger, Benjamin Jenkins, George Smith, Jethro Myrick, George Russell, Samuel Long, Abraham Pease, William Worth, Richard Coffin, and Benjamin Hussey, of Nantucket; Joshua Harding, of Cape Cod; Thomas Wiccum,* of New London; and Nailer Hatch, Cornelius Jenney, Francis Chase, Nymphas Price, Robert Gardner, and Zadock Lewis, unknown.

From 1770 to 1775 the state of the whale-fishery from Massachusetts was nearly as follows:†

Ports from which vessels sailed.	Number of vessels fitted annually for the northern fishery.	Tonnage.	Vessels fitted annually for southern fishery.	Tonnage.	Total number of seamen employed.	Barrels of sperm-oil taken annually.	Barrels of right-whale oil taken annually.
Nantucket	65	4,875	85	10,200	2,025	26,000	4,000
Wellfleet	20	1,600	10	1,000	420	2,250	1,250
Dartmouth	60	4,500	20	2,000	1,040	7,200	1,400
Lynn	1	75	1	120	28	200	100
Martha's Vineyard	12	720	.....	.....	156	900	300
Barnstable	2	150	.....	.....	26	240	.....
Boston	15	1,300	5	700	260	1,800	600
Falmouth, Cape Cod	4	300	.....	.....	52	400	.....
Swanzey	4	300	.....	.....	52	400	.....
Total	183	13,820	121	14,020	4,059	39,390	7,650

To this estimate must be added for Providence, Newport, Warren, Sag Harbor, New London, New York, about 50 vessels more, and the proportion carried through would add 4,600 tons of shipping, 450 men to the number of seamen, 6,500 barrels of sperm and 1,200 of whale oil to the above total.

The names of such of the captains as are known are as follows:

For 1771: Joshua Delano (sloop Defiance of Rochester), Eldridge, Jenney, Peter Fitch, Uriah Bunker, Caleb Lombard, Richard Whelden,

* Wiggin.

† "No less than 19 Sail of Vessels were cleared for a Whaling Voyage from Rhode Island the week before last."—Boston News-Letter, May 21, 1770. The sloop Marquis of Granby, Pelatiah Russell, master, is reported in February, 1770, at Cape St. Nicholas Mole with 170 barrels of oil, her crew of Indians having run off with one boat and craft. The sloop Deliverance, Marchant, of Dartmouth, in two voyages this year took 360 barrels. John Claghorn, mate of a Dartmouth brig, was taken out of his boat by a foul line and drowned—the fourth brother in a family of six who had lost his life in this way. A Providence brig, a Newport schooner, and a Rhode Island sloop (these accounts all seem to make a distinction between Rhode Island vessels and those from Newport), all whalers, went ashore at Tarpaulin Cove, and a Warren schooner was lost on Chatham bar.

Richard Coffin, Paul Rawson, Benjamin Church, John Squires, Tristram Gardner, Francis Barnard, Thomas Manter, Benjamin Paperdy (?), George Russell, David Swain, Cornelius Marchant, William Pease, Robert Wyer, Jonathan Barnard, David Clark, and John Winslow.

For 1772: ———, (sloop Defiance, of Rochester), Peter Wells, John Howland, Thomas Pain, Thatcher Rich, Elisha Doane, Jonathan Doane (Dartmouth), Thomas Ryder (Cape Cod), Jeremiah Bickford, William Moores, Benjamin Coffin (Nantucket), Joseph Smith, Elisha Cobb, S—— Swett, Thomas Groose, Jonathan Moores, David Swain, Stephen Sears, Obed Bunker, ——— Bunker (of Nantucket, in sloop Fancy), Paul Cook, Barnabas Atwood, ——— Jenney, Obed Nye. Two vessels from Marblehead were whaling during part of the season. Two sloops from Nantucket, with about 150 barrels of oil each, were captured by a Spanish brig and sloop off Matanzas. The sloops Pluto, of Acushnet, John Winslow master, and King of Prussia, of Nantucket, Paul Rawson master, were found in September bottom up, and it is supposed that the crews had perished. Brig Leviathan, Lathrop master, sailed from Rhode Island for Brazil Banks.

For 1773: John Delano (in sloop Neptune, of Dartmouth), Obed Nye, Matthew Price, Hugh Cathcart, Joseph Gardner, William Roberts, Francis Chase, ——— Wyatt, ——— Barlow, Paul Cook, Joseph Cartwright, Edmund Cottle, Nathaniel Coleman, Samuel Manter, Oliver Price, Matthew Price (in sloop Dolphin), Ephraim Pease, Marshall Jenkins, Benjamin Starbuck, Richard Coffin, Benjamin Foswick, Obed Hussey, Jonathan Doane, George Shockley, Isaiah Eldridge, Silas Butler. In August a schooner, ——— Worth master, arrived in New York, having taken with her consort (name or port not given) 380 barrels of whale-oil and between 7,000 and 8,000 pounds of bone. Sloop A, of Providence, Abishai Luce master, was damaged in a gale December 4, and lost two men.

For 1774 and 1775* (in brig No Duty on Tea, of Dartmouth): ——— Swain, Jonathan Mitchell, William Swain, Robert Wyer, George Allen (in command, the captain having been caught by a foul line while fast to a whale and drowned), Benjamin Jenney, Abishai Luce (see 1773), Michael Hathaway, Caleb Lombard, Benjamin Hussey, Benjamin Berry, Eleazer Hopkins, Luther Burgess, John Bassett, Francis Butler, John Squires, Benjamin Allen (Nantucket), Daniel Snow, Edward Wing, Abel Easterbrooks (Warren), Benjamin Coffin (Nantucket), William Ramsdell (ditto), ——— Meader (ditto). A whaling-sloop, owned by Gideon Almy, of Tiverton, and another, owned in Boston, were captured by a French frigate off Hispaniola, carried into Port au Prince and condemned.

* From the "No Duty on Tea's" log of a voyage to the Western Islands. On June 10, 1774, the sloop Rochester, commanded by David Squires, and owned by Nathaniel Macy, and the schooner Lowden, commanded by Peleg Swain, and owned by John Ramsdell, sailed from Nantucket on a whaling-voyage. They struck on Great Point Rip and were lost, the crews very narrowly escaping drowning.

1775 to 1783.

Between these years the fishery produced but little. Nantucket was the only port which attempted to carry it on, and the fleet from there suffered a rapid diminution in numbers, until at the close of the war 134 vessels had fallen into the hands of the English, and 15 had been lost at sea. Many of these had cargoes varying from a few barrels to the entire capacity of the vessel. A more complete account will be gained by reference to the historical portion of this work.

It appears from the records of Massachusetts that bonds were filed with the State treasurer for the following whaling-vessels:

George Hussey, jr., and Paul Hussey, sloop Harlequin, of Nantucket; Daniel Paddack, master.

George Hussey, jr., and Paul Hussey, brigantine Warren, of Nantucket; Benjamin Whippey, master.

George Hussey, jr., and Paul Hussey, brigantine Brittania, of Nantucket; Silas Jones, master.

George Hussey, jr., and Paul Hussey, brigantine Lark, of Nantucket; Paul Hussey, master.

Reuben and Elisha Swain, brig Speedwell, of Nantucket; Elisha Swain, master.

Joseph Hussey, of Nantucket, and Shubael Cottle, of Tisbury, sloop Fame; Stephen Skinner, master. (This vessel did not sail.)

Joseph Hussey, of Nantucket, and Shubael Cottle, of Tisbury, brig Donoho (?); Nathaniel Coleman, master.

Joseph Barnard and Stephen Hussey, both of Nantucket, schooner Delight; Timothy Coleman, master.

Same parties, brigantine Britannia; Zebulon Whippey, master.

Nathaniel Macy and Richard Mitchell, jr., of Nantucket, schooner Dighton; Silas Paddack, master.

Josiah Coffin and Richard Mitchell, jr., of Nantucket, schooner Mermaid; Josiah Coffin, jr., master.

Same parties, brigantine Ann, of Dartmouth; Simeon Coffin, master.

Reuben Gardner and Paul Bunker, of Nantucket, brigantine Enterprize; Jonathan Fitch, master.

Same parties, schooner Harrison; Peter Fitch, jr., master.

Richard Coffin and Stephen Hussey, of Nantucket, brig Mayflower; George Lawrence, master.

Ebenezer Calef and Stephen Hussey, of Nantucket, sloop Nightingale; Elisha Folger, master.

Richard Mitchell, jr., and Stephen Hussey, of Nantucket, schooner Roebuck; William Chadwick, master.

Same parties, brig Sherburne; Jonathan Burnell, jr., master.

Same parties, brigantine Pembroke; Obed Bunker, master.

Same parties, brig Mercury; George Bunker, master.

Francis Brown and Richard Gardner, of Nantucket, brigantine Warwick; Peleg Gardner, master.

Thomas Jenkins and Andrew Myrick, of Nantucket, brigantine Windsor; Stephen Kidder, master.

Thomas Jenkins and Stephen Hussey, of Nantucket, brigantine Polly; John Barnard, master.

Thomas Jenkins and Andrew Myrick, of Nantucket, sloop Mary; Barzillai Swain, master.

Josiah Coffin, esq., Richard Mitchell, jr., Thomas Jenkins, and Andrew Myrick, of Nantucket, brigantine Donahoe, brigantine Dover, sloop Nightingale, schooner Delight, brigantine Brittania, sloop Success, sloop Conway,* brigantine Monmouth, sloop Dove, brigantine Mayflower, brigantine Polly, brigantine Bedford, schooner Dighton, schooner Harrison, and brigantine Enterprise.

Thomas Jenkins and Andrew Myrick, of Nantucket, brigantine Hawk; George Clark, master.

Same parties, schooner Raven; Seth Mayo, master.

Same parties, schooner Adventure; James Coffin, master.

Same parties, brigantine Hannah; Nathan Folger, master.

Francis Rotch and Leonard Jarvis, of Dartmouth, brigantine Falkland; William Covell, master.

Same parties, sloop Defiance; Jonathan Mitchell, master.

Same parties, brigantine Fox; Silas Butler, master.

Same parties, brigantine George; Thomas Banning, master.

Same parties, brigantine Enterprise; James Whippey, master.

Aaron Lopez, of Newport, and Leonard Jarvis, of Dartmouth, ship Africa; Joseph Ripley, master.

Same parties, brig Minerva; John Locke, master.

Joseph Russell, Isaac Howland, Barnabas Russell, and Caleb Greene, of Dartmouth, schooner Juno; George Shockley, master.

David Shepherd, Seth Russell, David Sowle, Abraham Smith, brigantine Kezia; David Sowle, master.

John Alden and Walter Spooner, of Dartmouth, schooner Grampus; Job Springer, master.

Samuel Smith, jr., and Marshall Jenkins, of Edgartown, brigantine Frederick; Edmund Cottle, master.

Shubael Cottle and John Pease, jr., of Edgartown, sloop Hannah; Jesse Luce, master.

Jonathan Allen and Thomas Cooke, of Edgartown, schooner Spermaceti; John Pease, master.

Joseph Nye, jr., and Nathaniel Freeman, of Sandwich, schooner Catharine; Jonathan Coffin, master.

Same parties, schooner Elizabeth; Henry Folger, master.

*According to the certificates, the sloop Conway, Bartlett Coffin commander, landed 200 barrels of oil at Falmouth; the brig Donahue, Nathaniel Coleman, 201 barrels (from coast of Brazil); brig Polly, John Barnard, 220 barrels (from Brazil); sloop Mary, Barzillai Swain, 200 barrels and 1,000 pounds bone (brought by brig Liberty, Henry Folger); brig Hawk, George Clark, 200 barrels (from Brazil); schooner Raven, Seth Mayo 200 barrels (from Brazil); Mayflower, Charles Coleman, 200 barrels; all 1776.

David Nye, of Wareham, and Ebenezer White, of Rochester, schooner Desire; George Smith, master.

Francis Rotch and Leonard Jarvis, of Dartmouth, brigantine Ann; Simeon Coffin, master.

Same parties, brig Royal Charlotte; William Roberts, master.

Lemuel Williams and William Tallman, of Dartmouth, sloop Neptune; Luther Burgess, master.

Nathaniel Curtis, of Stoughton, Caleb Davis, late of Boston, now of Dedham, schooner Betsey; Nathaniel Curtis, master.

These bonds are all filed from August, 1775, to early in January, 1776, none appearing after the latter date.

The Bedford, of Nantucket, sailed in 1776 for Brazil Banks, and arrived March 13, 1777, full.

Table showing returns of whaling-vessels

Name of vessel.	Class.	Tonnage.	Captain.	Managing owner or agent.
1788.				
The sloop Rainbow, Capt. Joshua Delano, made a whaling-voyage from Dartmouth, sailing in company with vessels commanded by Elnathan and Nathaniel Delano. On the voyage the following captains were spoken —the oil reported at the date of hailing being given in brackets: —— Stott [from the West Indies, 100 barrels], Cornelius Butler, Benjamin Dillingham, George Allen, Amos Kelley, Robert Neader [from the West Indies, 100 barrels], Rufus Fish [40], —— Squires [30], Seth Folger [from Brazil, 500], Walter Brock [from Brazil, 500], Benjamin Hillman [40], Reuben Clark, Joseph Russell, [Nantucket], James Coffin, John Bassett [from Brazil, 600], Robert Hathaway [20], Abishai Luce, Joseph Russell [Dartmouth]. The larger number of these are unquestionably from Nantucket; others from the vicinity of Dartmouth, Cape Cod, &c. The Rainbow arrived July 25, and sailed again for a Gulf-Stream voyage August 5. On the second cruise she spoke Thomas Allen [4], Benjamin Hillman [4], George Allen [80], Edy Coffin, Benjamin Dillingham, Robert Hathaway [15], Rufus Fish, Jonathan Cushman, Daniel Bennett [70], Prince Shearman, Prince Hatch, and Ebenezer Allen. She arrived the second time September 17.

Two Nantucket schooners, with from 50 to 60 barrels of oil each, put into Boston, October 19, 1812; names not ascertained.

The brig Nanina, of Hudson, Capt. Valentine Barnard, sailed from New York April 4, 1812, for the Falkland Islands, whaling and sealing. Arrived there, the English brig Isabella, with a number of passengers, was found wrecked. The English officers offered Captain Barnard all of the Isabella's cargo which could be saved, if he would rescue them, to which he replied that his sense of duty commanded him to relieve them without reference to compensation; nevertheless, if they so desired, he would take the remnant of the wrecked cargo as some repayment for a spoiled voyage. Captain Barnard received the officers, crew, and passengers of the Isabella on board his vessel, and to reward him for his exertions and loss, his vessel and crew were infamously betrayed into the hands of English authorities, and he and his crew brutally treated. Tidings of the affair coming to the ears of the English naval commander in those waters, he dispatched a vessel to release the American captives. Captain Barnard's protest appears in the Hudson Bee in 1814.

Two vessels sailed from San Francisco—the Nile and the Russell. The data in regard to San Francisco and Provincetown are extremely hard to get at; vessels are reported arriving, with no date of sailing, and sailing, with no date of arrival; and the product is often wholly ignored in the reports. The Nile arrived September 30, 1851, with 500 whale.

J.—*Recorded summary of importation of oil and bone, and total value computed for each year, commencing January 1, 1804, and ending December 31, 1876, with gross valuation for the whole period.*

NOTE.—From 1804 to 1817 it would appear by the table of exports that much oil and bone was imported which is not credited to any port. Assuming the exportation of whale-oil for that period at one-third of the importation, and the exportation of bone at two-thirds of the importation, it is necessary to add to the former 9,226,834 gallons, and to the latter 206,551 pounds.

Year.	Gallons sperm-oil.	Average price per gallon.	Gallons whale-oil.	Average price per gallon.	Pounds whalebone.	Average price per pound.	Total value.

.....	(†)	.....	9,226,834	59	206,517	9	5,462,418 59
Total.	161,452,702	.....	266,996,217	.....	75,268,361	.....	331,947,480 51

† Deficit, as per note at head of table.

NOTE.—Scammon estimates that sperm whales will average 25 and right whales 60 barrels of oil, and of the former 10 and of the latter 20 per cent. of those killed are lost. Upon that basis the above amounts of oil would represent the slaughter of 225,521 sperm, and 193,522 right whales.

K.—*Synopsis of importation, by ports, from 1804 to 1877.*

NOTE.—These returns, up to 1838, excepting in the cases of Nantucket, Sag Harbor, and New London, are made up mainly from the newspaper reports of the voyages, an occasional estimate being made when there was no report of oil.

Port of departure.	Nature and number of vessels returning.			Importation.			Tonnage.

* From 1803 to 1817 the values of sperm oil and candles are aggregated, as also are those of whale oil and bone.
† Spermaceti and spermaceti-candles are aggregated in reports for this year.
‡ Including paraffine.
§ Also "whale-foots," worth $6,290.
‖ Including wax.

M.—*Table of tonnage of vessels engaged in the whale fishery.*

[From the Report of the Secretary of the Treasury, 1817.]

Year.	Tonnage.	Year.	Tonnage.	Year.	Tonnage.
1794	4,139	1802	580	1809	573

Special table of the whaling interest of New Bedford and Fairhaven.

[From Hazard's Register.]

Year.	Barks and ships.	Tons.	Year.	Barks and ships.	Tons.
1820	94	27,475	1834	171	54,488
1830	116	35,209	1835	178	56,530
1831	146	45,102	1836	208	64,260
1832	150	50,068	1837	205	62,812
1833	178	56,352	1838	213	63,982

* These tables are hardly accurate enough to show the extent of the business. Thus, at the close of 1815, Nantucket had at least 8,300 tons of shipping engaged in whaling; New Bedford district, 2,200; Hudson, N. Y., 250; Sag Harbor, N. Y., 750—in all, about 11,500 tons In 1818 there were at least 18,000 tons.

TABLE OF CONTENTS.

A.—INTRODUCTION:

Value of the fisheries as accessories to advancing civilization, 1. (*Note.*—Intentions of S. H. Jenks, esq., and Hon. L. Sabine to write the history of whaling; difficulties in the way of compiling the history; names of parties to whom the author is specially indebted for assistance, 1.) Whalemen the first to display the American flag in foreign ports, 2. The influence of the fisheries in our national politics and diplomacy, 3. (*Note.*—The experience of a Russian and an English exploring party, 3.)

B.—ACCOUNT OF THE WHALE-FISHERY from 1600 to 1700:

MASSACHUSETTS.—Origin of the American whale-fishery, 4. Why the Puritans favored Cape Cod, 4. (*Note.*—Grant to Massachusetts under the charter, 4.) Indian whaling, 5. (*Note.*—Whales numerous along the coast of America, 5.) Protection and promotion of the fisheries by Massachusetts, 6. Drift whales, 6. (*Note.*—Indian custom; Greenlander's idea of heaven; Purchas's account of whaling, 6.) Letter from the general court of Plymouth to Sandwich, Barnstable, Yarmouth, and Eastham, and reply, 7. Tradition of William Hamilton; its apparent unreasonableness, 7. (*Note.*—Order of Plymouth court concerning drift whales, 7.) Testimony of Randolph to value of whale-fishery, 8. Regulations of general court of Massachusetts concerning drift whales, 8. Inspectors of whales appointed by the Plymouth government; their duties defined, 8. CONNECTICUT.—Whaling from Connecticut, 9. Resolve of the general court, 9. NEW YORK.—The first organized prosecution of whaling probably from Long Island, 9. Regulations of the town of Southampton, 9. (*Note.*—Settlement of Southampton, 9.) Whaling from Easthampton, 10. Petition of Easthampton, Southampton, and Southwold to the English government, 10. Action of the Dutch, 11. Letter from Samuel Mavericke to Colonel Nicolls, 11. Confirmation by Governor Lovelace of order of Southampton, 11. Drift whales, 12. Employment of Indians, 12. Absorption of the trade in oil by the New England colonies, and consequent disturbance of the authorities at New York, 13. The Dutch interregnum, and its hardships to the people of Long Island, 13. Oppression of the colonial government; petition of Benjamin Alford, of Boston, 14. (*Note.*—Blank form of clearance, 14.) Act to encourage trade and navigation, 15. Petition of Timotheus Vanderuen for permission to sail to the Bahamas sperm-whaling, 15. Whaling on Long Island, 1688, 15. Rate of exchange at Easthampton, 1688, 15. First whaling expedition at Nantucket, 16. Proposed agreement of James Loper, 16. (*Note.*—Probability that Loper never settled in Nantucket, 16.) The islanders employ Ichabod Paddock, 17. Whaling at Martha's Vineyard, 17. (*Note.*—Paddock at Nantucket, 17.) Whaling from Salem, 18. From Canada, 18. (*Note.*—Canadian whaling, 18.)

C.—WHALE-FISHERY from 1700 to 1750:

Shore whaling at Nantucket, 19. (*Note.*—Late prosecution of this pursuit from Southamption, 19. The first sperm whale taken by Nantucket men, 20. Whaling out in the "deep," 20. Oil shipped from Nantucket to London in 1720, 20. (*Note.*—Drift sperm whale on Nantucket; bill of lading, 20.) Increase of the business, 21. (*Note.*—Vessels registered from 1694 to 1714; Russian India Company ordered to fit out whalers; statement of Greenland whaling; Sweden, 21.) Exports to England, 1730, 22. Culminating point of shore-whaling at Nantucket, 22. First recorded loss of a whaling vessel from Nantucket, 22. (*Note.*—Names of the whale-boat captains at Nantucket and what they did in 1726; rescue of William Walling by a Nantucket whaleman; vessel of 118 tons burden built at Nantucket in 1732; accidents from whaling; petition of Dinah Coffin, 22.) Increase in the business at Nantucket, 23. Indians employed, 23. Cape Cod and Long Island called upon to supply the deficiency of men, 23. (*Note.*—Anecdote of Indian crew shore-whaling; Indian carried down by a foul line, 1744; imports of oil at London from New England, 1729, 23.) Nantucket merchants ship oil to London, 24. Date of Davis's Straits fishery, according to Macy, 24. LONG ISLAND.—Difficulties between the Long Islanders and the New York government, 24. (*Note.*—Indian plot at Nantucket, and fears for whaling fleet; Macy's date of Davis's Straits fishery erroneous, 24.) Quarrels between the New York governors and the whalemen, 25. Act for "Encouragement of whaling," 25. (*Note.*—Whale ashore at Nantucket; drift whales at Suffolk County, New York, 25.) Quantity of oil brought into Long Island and the fishing season, 26. Endeavor to monopolize the business, 26. Samuel Mulford, of Easthampton, *vs.* the New York colonial government, 26. EASTHAM.—Petition of the people of Eastham and vicinity for exclusive leave to make available the waste of whales, 30. Falmouth Indians discharged from the army to attend to the whale-fishery in 1724 and '25, 31. Renewed activity in whaling from Cape Cod, 31. (*Note.*—Severe storm at Provincetown in 1728, 31.) Boat's crew lost near Chatham, 32. Large whale killed at Provincetown, 32. Accident to a Chatham crew, 32. Ill success at Provincetown, 32. Accident, 32. (*Note.*—A dozen whalers fit from Provincetown, 1737, 32.) French and Spanish privateers, 33. Provincetown in luck, 33. (*Note.*—Accident at Truro; gradual recession of whales, 33.) Captain Roach's vessel seized by a French privateer, 34, Salem, 34. Boston, 34. (*Note.*—Whale killed in Boston harbor; whale warps and blubber advertised; price of whalebone quoted, 1723, 35.) RHODE ISLAND.—Acts of the assembly encouraging whaling, 35. According to Arnold, the first regularly-equipped whaleman from Rhode Island arrives in 1733, 35. (*Note.*—Arnold probably in error; William Bennett arrives in 1723, 35.) Whaling at Martha's Vineyard, 35. Sailing of the Diamond, Leopard, Humbird, and Susannah, and result of the experiments, 36.

D.—WHALE-FISHERY from 1750 to 1784:

An eventful period for the fishery, 36. English bounties, 36. Concession of bounties to the colonies a part of the scheme for the expulsion of the Acadians, 37. Embargo on bank-fishermen, 38. (*Note.*—Colonists taxed to support a frigate on the banks, 38.) Petition of John Norton, for Martha's Vineyard, and Abishai

D.—WHALE-FISHERY from 1750 to 1784—Continued.

Folger, for Nantucket, for permission to whale, 38. (*Note.*—Usual course of whalemen, 38.) Opening of the Saint Lawrence and Belle Isle whaling-ground, and its monopoly, 39. Petition of American oil merchants against unjust discriminations, with statement of fishery, 39. (*Note.*—Names of 75 Nantucket whaling captains in 1763, 39.) Influence of the colonial whale-fishery on English politics, 40. Nantucket whalemen captured by French privateers, 41. Nantucket and Martha's Vineyard, 42. Further misfortunes to the Vineyard whaling fleet, 42. Boston's share in the business, 42. Whalemen lost, 42. (*Note.*—Revival of fashions, 42.) LONG ISLAND.—Three sloops fit from Sag Harbor in 1760, 43. (*Note.*—Sag Harbor settled in 1630, 43.) RHODE ISLAND.—Reports of whaling there in 1766, 43. Williamsburgh, Virginia, sends out a whaling-vessel, 43. Dartmouth invests in the business, 43. (*Note.*—Ricketson's account; accident to a Dartmouth man, 43.) Extract from log of the whale-ship Betsey, 44. English governors claim a monopoly of the Saint Lawrence fisheries, to the exclusion of the colonists, 44. Their orders, proclamations, and acts, and the effects upon colonial whaling, 45. (*Note.*—Extracts from the Boston News-Letter in 1766, 45.) (*Note.*—The main features of the fishing act of William III, 47.) The misdeeds of whalemen, as recited by Palliser, doubtless exaggerated, 48. Whaling at the southward, 49. Providence, New York, and Newport, their connection with the business, 49. (*Note.*—Reported success of the people of Nantucket, 49.) Resumption of the Saint Lawrence fishery, 49. Casualties there, 50. (*Notes.*—Extract from log of the Tryall, of Dartmouth; affray of Indians on a Nantucket vessel, 50.) The whaling fleet of 1768, 50. (*Note.*—Nantucket's fleet; fight between the crew of a Marblehead brig and a press-gang, 50.) From 1770 to 1775, community of interests among the inhabitants of Nantucket, 51. (*Notes.*—Whalemen fitted from Middletown, Conn.; method of settling voyages; Nantucket's home-workmen interested in the result of the voyages, 51.) (*Notes.*—Difference between "head" and "body" oil, 52. Description of cutting-in a sperm whale, 52. Restrictions on colonial commerce, 53.) Capture of whalemen by French and Spanish privateers in 1771, 53. Crews of two Nantucket whaling-sloops capture a piratical ship, 54. American navigators and the Gulf Stream; English self-sufficiency, 55. The course of the Gulf Stream first charted by a Nantucket captain, 55. Whalemen captured by Spanish cruisers in 1772, 56. (*Note.*—The Rhode Island fleet: a fish story, 56.) Whaling on the coast of Africa, 56. Massacre of part of the crew of a Boston brig, 56. Captures by the French, 56. (*Note.*—Dates of the fishery in different localities, 56.) The Portuguese mode of obtaining experience in 1774, 57. (*Notes.*—Infrequency of going into a port of some whaling-ships; description of a "snow," 57.) Statistics of the fishery in 1774, 57. (*Note.*—Detailed statement of the business from 1771 to 1775, 57.) The Revolution, 58. Massachusetts the focus of insurrection, 58. The fisheries first to feel the shock of war, 58. (*Note.*—Importance of colonial trade to England, 58.) Efforts of the English government to reduce New England by restrictions upon her fisheries, 59. Strenuous fight of the minority in Parliament, 59. Petitions against the restraining act, 59. (*Note.*—Evidence introduced by the opponents of the act, 59.) Arguments against the passage of the act, 60. Burke's eloquence, 60. (*Note.*—The Falkland Islands, 61.) Relief for Nantucket, 62. Massachusetts also passes a

D.—WHALE-FISHERY from 1750 to 1784—Continued.

restraining bill, 62. Nantucket relieved of its rigors, 62. Resolve of the general court of Massachusetts in regard to whaling-vessels, 62. Nantucket alone in the business, 62. (*Note.*—Importation of gunpowder; complaint of the Earl of Dartmouth, 62.) Desperate strait of the islanders, 63. Petitions to the general court of Massachusetts for permission to sail on whaling voyages, 63. (*Note.*—Form of bond required by the general court, 63.) Attempt to secure the alliance of France and Spain, and the position of the fishery question, 64. How England was affected by the cutting-off of colonial commerce, 64. Efforts of the English ministry to transfer the fisheries to Great Britain, and their result, 64. (*Note.*—Captures of American whalemen, 64.) Terrible calamity on the banks of Newfoundland, 65. (*Note.*—Distress at the Barbadoes, 65.) Further severity of the English government, 65. Its operation on American commerce, 66. (*Note.*—Heroism of a ship captain, 66.) Letter from John Adams detailing the method by which England prosecuted the whale-fishery, 66. (*Note.*—Report from Messrs. Franklin and Adams of captives, 66.) List of some of the captains of whaling-vessels forced into the English service, 66. Destruction of property by the British in sea-port towns in 1778–'79, 68. (*Notes.*—British fishery at Canso destroyed; abstract of property destroyed by the British at New Bedford, Fairhaven, Falmouth, Edgartown, Holmes's Hole, Sag Harbor, and Warren, 68.) Further negotiation between the United States and France, 68. Sad state of affairs at Nantucket, 71. Petitions to the Federal and British authorities for permission to live, 72. (*Note.*—Correction of slanders by Mr. Rotch; form of permit issued by the English, 72.) Difficulties in prosecuting the fishery, 73. (*Note.*—Destroyed and defaced records, 73.) Petition of the people of Nantucket reciting their distressed condition and praying for relief, 74. Reference to the Continental Congress, 75. (*Note.*—Explanation of a charge against the islanders, 75.) Nantucket sends two citizens to Philadelphia to intercede with Congress for relief, 76. Diplomatic battle on the terms for peace, 76. (*Note.*—Congress grants 35 licenses to Nantucket vessels to whale, 76.)

E.—WHALE-FISHERY from 1784 to 1816:

The condition in which the war left the business of whaling, 77. Nantucket's sacrifice on the altar of liberty, 77. (*Notes.*—Loss of men to Nantucket; Warren's loss, 77.) The first ship to hoist the "rebellious stripes of America" in any British port, 77. (*Notes.*—Anecdote of a sailor; where and when the Bedford was built, 77.) Revival of whaling, 78. New ports enter into competition, 78. The market overstocked, 78. Bounty on oil, 78. The bounty injurious to the business, 79. Effort to transfer the fishery to foreign ports, 79. Mr. Rotch in England, 79. (*Note.*—Letter of Capt. Alexander Coffin to Hon. Samuel Adams, 79.) Negotiations with the English and French governments, 79. English obstinacy and French concession, 81. National negotiations for a treaty of commerce, 81. The American minister thoroughly alive to American necessities, 82. (*Note.*—One hundred whalemen in 78° north latitude;* whalemen as far north as 79° 2′ 82″.) (*Note.*—The Portuguese fishery, 85.) Massachusetts navigation act only operative against Great Britain, 85. Letter from James Bowdoin to Minister Adams, 85. (*Note.*—The English sperm-whale

* The latitude is misprinted in the note.

E.—WHALE-FISHERY from 1784 to 1816—Continued.

fishery, 87.) Effect of foreign bounties on the American fishery, 87. Founding of Dartmouth, Nova Scotia, 88. (*Note.*—Why the transfer from Nantucket to Nova Scotia suddenly stopped; Mr. Rotch returns to the United States 1796, 88.) Milford Haven supplants Dartmouth, 88. The Dunkirk transfer not a success, 88. France favors the United States, 89. (*Notes.*—Consumption of oil in France; comparative statement of the English and American fisheries in 1775 and 1788, 89.) Revival of the fishery in the United States, 90. Vessels fitting out for the Pacific Ocean, 90. (*Notes.*—Sag Harbor and New Bedford recommence whaling; the Pacific fishery; singular incident in Woolwich Bay, 90.) French spoliations, 91. (*Notes.*—Report that England would monopolize the Delago Bay ground; sensitiveness of the people of Nantucket on the subject of spoliations, 91.) Ships seized and condemned in Spanish America, 92. Augmentation of the whaling-fleet, 92. (*Note.*—East Haddam and New London vessels, 92.) The war of 1812, 92. Rapid diminution of the fleet by capture, 92. (*Notes.*—Meeting of ship-owners at Nantucket, 92; captured whalemen used in the English fishery, 93.) Lima seizes American whalemen, 93. Poinsett effects their release by the eloquence of powder and balls, 93. (*Notes.*—The Nanina, of New York, betrayed by a rescued English crew; the Sally and Triton, of New Bedford, captured, 93.) Captain Porter sent to the Pacific to protect American shipping, 94. Destruction of the English Pacific fishery, 94. (*Notes.*—Capture and recapture of the Walker and the Barclay, of New Bedford; amusing anecdote of a duel, 94.) An English privateer on the coast, 94. (*Note.*—Vessels captured by Porter, 95.) Peace, 95. Resumption of whaling, 95. Activity of the people of Nantucket, 95. (*Note.*—Degrand on the Nantucket fleet, 95.) Strong competition, 96. New grounds opened, 96. (*Note.*—Amusing but rather erroneous prophecy of Nantucket captains, 96.) Daring of the "toilers of the sea," 97. Wilkes, Perry, and Maury indebted to our whalemen for much information; Agassiz on the Hayes expedition; cruelties practiced upon the South Sea islanders, and their legitimate fruits, 97. Even the Red Sea invaded, 98. The golden age of whaling, 98. The Kodiah ground, 98. The first bow-head whale, 98. (*Note.*—Difference of opinion as to who first ascertained the value of the bow-head, 98.) Captain Royce enters the Arctic, 98. (*Note.*—Extract from the Saratoga's log, 98.) (*Note.*—Record of thirteen Arctic whalemen in 1849, 99.) Gradual diminution of the fleet, 100. (*Notes.*—Ludicrous fears of a manufacturer; revival of the English South Sea fishery; San Francisco, Monterey, and Crescent City become whaling ports; remarkable journey of wrecked oil, 100.) The rebellion and its effect upon whaling, 100. Capture of whalemen, 101. Atrocious manner of capture, 101. Sale and transfer of vessels, 101. The stone fleets, 101. (*Note.*—History of the Corea, 101.) The Shenandoah enters the Pacific, 102. Fearless conduct of Captain Young, of the bark Favorite, 102. (*Notes.*—Names of the stone fleet and the captured whalemen, 102.) Captain Nye mans his boats to warn his brother whalemen, 103. Ravages of the Shenandoah, 103. Alacrity with which the sea-port towns responded to the calls for men, 103. (*Note.*—Whaling-agents in Payta tender their services to the government, 103.) Terrible disaster in the Arctic, 103. (*Note.*—Table of Arctic whaling, 103.) (*Note.*—Protest of the captains of the beleaguered whale-ships, 107.) (*Note.*—Names and value of the fleet, 108; condition of what was left in 1872,

E.—WHALE-FISHERY from 1784 to 1816—Continued.

109; another disaster, 109; lowest ebb of the fishery, 109.) Constant decline of the business, 109. Its condition in 1877, 109. Causes of its decline, 109. (*Notes.*—Atlantic whaling, 110; cost of outfitting, 110. (*Note.*—Enormous outlays in refitting in the Pacific, 112; consular care for personal interests, 113; testimony of an English journal to the value of the whale-fishery to the United States, 113; what has been done by our seamen, 113.)

F.—DANGERS OF THE WHALE-FISHERY:

The position of whaling captains as navigators, 114. (*Notes.*—Comparative rates of English and American insurance; a Nantucket captain, 114.) Loss of the ship Union, of Nantucket, 115. (*Note.*—Instances of vessels running upon whales, 115.) Belligerent whales; loss of the Essex, of Nantucket, 116. (*Note.*—Careful avoidance of the subject of his terrible boat-journey, by Captain Pollard, 119.) Loss of the Ann Alexander, of New Bedford, 119. (*Note.*—What became of the whale which sunk the Ann Alexander; similar accidents to vessels, 121.) Fighting whales; attacks on boats, 122. The Hector, of New Bedford, 122. (*Notes.*—Position of the sperm whale in attacking; the Emerald, of New Bedford; description of a whale-boat, 123.) The Parker Cook, of Provincetown, 123. Captain Huntting, 125. Furious attack by a right whale, 126. (*Note.*—Modes of attack by the right and sperm whales, 126) (*Note.*—The secret of the weakness of the right whale overlooked by naturalists, 127.) Method of signaling to boats from the ship, 128. (*Notes.*—Sunk whales; different opinions as to the captain's place, 129.) Fights with the savages; the Awashonks, of Falmouth, 129. (*Note.*—Vessels which have been attacked in a similar manner to the Awashonks, 131.) Lost boats; the Janet, of Westport, 132. (*Note.*—Statement of the Janet's mate; the Massachusetts, of New Bedford; foul lines, 133.) Mutinies, 133. The Globe, of Nantucket, 134. The Junior, of New Bedford, 135. (*Note.*—The William Penn, of San Francisco, 136.) Polar whaling and its perils, 136. Letter from Captain Pease, of the Champion, of Edgartown, 136. Letter from Captain Kelley, of the James Allen, of New Bedford, 138. Heavier anchors and cables needed in Arctic whaling, 139. Hudson's Bay, 139. (*Notes.*—Extract from Malte Brun; the Ansel Gibbs, of New Bedford, 139.) Horrible tale of the English whale-ship Diana, 140. Shipwrecks; the Canton, of New Bedford, 140. The Junius and Logan, of New Bedford, 141. The Lawrence, of ———, 141. (*Note.*—The Manhattan, of Sag Harbor, rescues 22 shipwrecked Japanese; doubts as to reported shipwrecks, 141.) The Lagoda, of New Bedford, 142. (*Note.*—One of the crew of the Plymouth, of Sag Harbor, visits Japan, 142.) Fire; the Cassander, of Providence, 142. Boring-worms, 144. The Minerva 2d, of New Bedford, 145. (*Note.*—The Niphon, of Nantucket, 145.)

G.—MISCELLANEOUS:

Good voyages; the Wilmington and Liverpool packet, of New Bedford, 145. The Uncas, of Falmouth, 146. The Loper, of Nantucket, 146. The Sarah, of Nantucket, 146. The South America, of Hudson, 146. The Magnolia, of New Bedford, 146. The William Hamilton, of New Bedford, 146. The America, of New Bed-

G.—MISCELLANEOUS—Continued.

ford, 146. The Maria, of Nantucket, 146. The Silas Richards, of Sag Harbor; the Bowditch, of Providence; the Cordelia, of Provincetown, 146. The Lowell and General Williams, of New London, 147. The South America, of Providence; the Russell, of New Bedford; the Plymouth, of Sag Harbor, 147. The Coral, of New Bedford, 147. The Envoy, of New Bedford, 147. The Arctic fleet, 148. The Favorite, of Fairhaven; Montreal and Sheffield, of New Bedford, 148. The Pioneer, of New London, 148. Success not confined to large vessels, 148. The Admiral Blake, James, and Altamaha, of Sippican, 148. The Watchman, of Nantucket, 148. (*Notes.*—Arctic whalebone; ambergris, 148.) Bad voyages, 148. The Clifford Wayne, of Fairhaven, 149. The Emeline, of New Bedford, 149. The Benjamin Rush, of Warren, 149. $1,000,000 loss in 1858, 149. $36,000 loss to Provincetown in 1870, 149. Sperm candles; Macy's account of the manufacture, 149. (*Notes.*—Macy manifestly in error in date; petition of Benjamin Crabb, 149.) Exports of sperm candles from 1791 to 1815, 153. (*Notes.*—Duck factories at Salem, Boston, Nantucket, and Newport; bounty for the manufacture of duck by the general court of Massachusetts, in 1727; candle factories in Hudson, in 1797, 153.) Harpoons lost and found, 154. Whistling whale, 154. Large whales, 155. (*Notes.*—Recovery of an iron; use of whalebone unknown in 1578; list of its present uses, 155.) Whalebone, 155. Description of the right whale, 156. Prices of whalebone, 156. (*Note.*—Use of the bone in the whale's economy; high price of cut-bone, 156.) (*Note.*—Description of brit, 157.) Large whales, 158. (*Note.*—Liability to exaggeration, 158.) Endurance and strength of whales, 158. Thirty-one bomb-lances required to subdue one, 159. (*Note.*—A whale takes out nearly six miles of line, 159.) "Settling" of whales, 159. Appearance and disappearance of whales, 159. (*Note.*—Large captures from schools of whales, 159.) Description of the capture of a whale, 160. (*Note.*—Whale-boats from rival nations struggle for a whale in the South Pacific, 162; how the American stole a march on the Englishman, in Delago Bay, 163.)

H.—INTRODUCTORY TO RETURNS, 166.

I.—RETURNS OF WHALING-VESSELS from 1715 to 1784, 168.

J.—SUMMARY OF IMPORTATION OF OIL AND BONE from January 1, 1804, to January 1, 1877, 660.

K.—SYNOPSIS OF IMPORTATION BY PORTS from 1804 to 1877, with the nature and number of vessels returning, and (from 1839) the class and tonnage of vessels engaged, 662.

L.—EXPORTS FROM THE UNITED STATES, the products of the whale-fishery, from 1791 to July 1, 1876, 700.

M.—TONNAGE OF VESSELS ENGAGED IN THE WHALE FISHERY, 702.

M.—AGGREGATE YEARLY TONNAGE OF VESSELS ENGAGED IN THE WHALE-fishery from 1794 to 1816, and from 1818 to 1839, 702.

N.—SPECIAL TABLE OF THE YEARLY TONNAGE OF VESSELS ENGAGED IN whaling from New Bedford and Fairhaven from 1820 to 1839, 702.

INDEX TO VOYAGES BY VESSELS; names arranged alphabetically, and towns also in alphabetical order, 711.

GENERAL ALPHABETICAL INDEX, 764.

LIST OF ILLUSTRATIONS, 768.

ERRATA.

Page 322. Include both entries to Imogene of Provincetown in one.
Page 377. Reverse the notes to the Sharon and the Oregon, of Fairhaven.
Page 411. Note to Albion, Fairhaven, should be credited to Belle, of the same port, on pages 412, 413.
Page 505. Note to Morea should belong to Morning Star.

INDEX TO VOYAGES BY VESSELS' NAMES.

A.

BOSTON, MASS.:
Ardent, *brig*, 244.* (See Provincetown.)
Afton, *bark*, 488.*
Acorn, *bark*, 590.*
A. Pickering, *bark*, 614.*

BRISTOL, R. I.:
Ann, Anne, or Anna, *ship*, 270,* 274, (274,) 280, 286, 292, 302, 338; *bark*, 380, 428.
America, *ship*, 280,* 286; *bark*, 292, 330,* 352, 370.*
America, *bark*, 352.

BRIDGEPORT, CONN.:
Atlantic, *ship*, 304,* 314, 322, 342, 360, 370, 382, 396.*

COLD SPRING, N. Y.:
Alice, *bark*, 416,* 442, 466, 490, 520.

DARTMOUTH, MASS.:
A. R. Tucker, *bark*, 484,* 506, 550. (See New Bedford.)

EDGARTOWN, MASS.:
Apollo, *ship*, 222, 228, 234, 250, 252.
Almira, *ship*, 244, 252, 264, 280,* 300, 336, 358, 400, 446, 484, 530, 562, 600, 632.
Athalia, *ship*, 358, 368,* 384.*
Alfred Tyler, *bark*, 412,* 456, 506.*
American, *ship*, 506*; *bark*, 554.*

FAIRHAVEN, MASS.:
Augenora, *brig*, 224.*
Amazon, *brig*, 238, 244, 248, 252, 256, 258, 262, 268, 276, 290, 298, 334, 354, 366, 376 424, 442, 494; *bark*, 538.*
Albion, *brig*, 268, 272, 276, 282, 290, 298,* 308, 326, 346, 366, 388,* 410, 446, 482, 516.*
Arab, *bark*, 238, 282, 316, 334, 366, 400, 436, 470, 506, 560, 576,* 582.*
Arab, *ship*, 298,* 316, 326,* 346, 366, 388, 424, 462, 506, 552.*
Addison, *ship*, 298, 308.* (See New Bedford.)
Ansell Gibbs, *ship*, 316,* 354, 400, 424, 462, 516, 576.*
Alto, *bark*, 324, 346, 366,* 588,* 598. (See New Bedford.)
Acushnet, *ship*, 376,* 424,* 454.*
Adeline Gibbs, *ship*, 376, 424, 454,* 506, 552, 608.
Arctic, *ship*, 470,* 516,* 538.*
Alfred, *schooner*, 538.*
Abbott Lawrence, *brig*, 618,* 632.*
Atkins Adams, *ship*, 436,* 470, 516; *bark*, 560.*

FALL RIVER, MASS.:
Ann Maria, *brig*, 330, 338, 348, 372,* 380, 402, 428.*
Ærial, *bark*, 488,* 500, 510.*
A. Houghton, *bark*, 510,* 556.*

FALMOUTH, MASS.:
Awashonks, *ship*, 278,* 302,* 330, 366, 454,* 486,* 518.*

GREENPORT, N. Y.:
Armida, *schooner*, 512.*

HOLMES'S HOLE, MASS.:
America, *bark*, 570, 590.* (From Mattapoisett.)

* Signifies that a marginal note accompanies the record of the vessel.

HUDSON, N. Y.:
American Hero, *ship*, 192, 194.
Alexander Mansfield, *ship*, 288, 304, 320, 342.*
America, *ship*, 304, 342, 360.*

LYNN, MASS.:
Atlas, *ship*, 284, 292, 296, 306, 318.*

MARBLEHEAD, MASS.:
Atlas, *ship*, 300.

MARION, OR SIPPICAN, MASS.:
Altamaha, *schooner*, 498,* 518, 530, 538, 570, 582, 588,*
Admiral Blake, *schooner*, 508,* 518,* 530,* 538, 562, 578, 582, 588, 594, 600, 606, 620, 626,* 644,* 648, 652, 656.

MATTAPOISETT, OR ROCHESTER, CONN.:
Annawan, *brig*, 326, 336, 346.*
Annawan, (2d,) *brig*, 378,* 402, 414, 436, 454, 470, 496, 518, 528, 552; *bark*, 570.*
America, *brig*, 436,* 454, 470, 496, 518.*
America, *bark*, 528,* 570.* (See Holmes's Hole.)
Amelia, *brig*, 540,* 562, 578.*

MYSTIC, CONN.:
Æronaut, *ship*, 312, 330,* 350, 372, 406, 432, 464, 496, 512, 532.*
Atlantic, *ship*, 420.*
Alibree, *bark*, 420,* 448.
Antarctic, *ship*, 448.*

NANTUCKET, MASS.:
Asia, *ship*, 186.
Africa, *ship*, 186.
Amazon, *ship*, 186, 188, (2 places.)
Alliance, *ship*, 186, 187,* 192, (2 places,) 194, 196, 198, 200, 202, 204, 206, 210, 212.
Atlas, *ship*, 198, 206, 208, 212, 216, 222, 230.*
Alligator, *ship*, 200, 202, 206, 210.*
Aurora, *brig*, 200.
Aurora, *ship*, 202.
Alert, *brig*, 206, 216,* 222, 230, 242.
Adolphus, *sloop*, 206.
Amphibious, *schooner*, 218.*
Antoinette, *schooner*, 218.* (Probably a small sealing-schooner.)
Aurora, *ship*, 228,* 246, 260, 278, 298, 336, 376, 426.
Ark, *ship*, 228.*
Atlantic, *ship*, 228,* 242, 254, 356, 438, 518, (2 places.)
Ann, *schooner*, 236.
Alexander, *ship*, 236, 250, 260, 284.*
Ann, *ship*, 260,* 278, 298, 336.*
American, *ship*, 264,* 278, 308, 346, 376, 426, 472.*
Atlantic, *ship*, 264, 270, 290, 326, 400, 472, 564.*
Alexander Coffin, *ship*, 290,* 326, 366.* (See New Bedford.)
Alpha, *ship*, 308,* 346, 390,* 438,* 472, 528, 578.*
Amazon, *sloop*, 308.
Alabama, *ship*, 438,* 484,* 528,* 578.*
Apphia Maria, *ship*, 472,* 528.*
Abby Bradford, *schooner*, 620, 632.* (See New Bedford.)
Amy, *bark*, 612.*

NEW BEDFORD, MASS.:
Atlantic, ——, 190, (2 places.)
Ann, *ship*, 192, 196, 200, 206, 214, 372.
Abby, *brig*, 198, 200, (2 places,) 202.
Acushnet, *ship*, 206.
Augustus, *ship*, 226,* 230.
Alliance, *brig*, 230,* 232, 238.

APPENDIX B.

INLAND FISHERIES.

II.—FISHERIES OF CHICAGO AND VICINITY.

By E. W. Nelson.

A—SOURCES OF INFORMATION.

In this report of the fisheries of Chicago and vicinity, I have included, besides those of Lake Michigan, those of the various small lakes and rivers near, so far as data could be obtained.

Although the latter are not of great extent, nor of much commercial importance, yet the information gained concerning the species found in them will be of some value to those investigating the character of streams and their inhabitants for the purpose of re-stocking exhausted streams and introducing valuable food-fishes not indigenous.

The facts regarding the fisheries along the shore of Lake Michigan and on the Calumet River have been obtained from the proprietors of the fisheries and from personal knowledge. For information regarding the fisheries at Joliet, Lockport, and Lemont, I am indebted to Mr. P. A. Downey, who formerly resided at Joliet, and is well posted regarding the matter.

To Mr. J. F. Browne, city fish-inspector of Chicago, I am indebted for the statistics of the amount of fish handled by the wholesale dealers of the city during the year ending December 1, 1875, and for information regarding the fish-trade; also to Mr. A. W. Brayton, of Englewood, Ill., for aid in various ways.

B—RECENT INCREASE IN SALES.

Since Mr. J. W. Milner's investigations in 1871–'72, the wholesale trade has increased rapidly in Chicago, as is seen by the following tables. The first table is taken from Mr. Milner's report, (United States Fish Commissioner, 1872–'73, page 7,) and shows the number of pounds of fish handled by the wholesalers of Chicago for 1872, as follows:

Hard fish.	Mixed fish.	Soft fish.	Lake-herring.	Sturgeon.	Salt fish.	Total.
4, 712, 198	13, 800	17, 784	167, 673	25, 147	2, 519, 500	7, 461, 102

A slightly different classification* has been adopted since, and they are arranged as follows for 1874–'75, the numbers representing half-barrels or packages containing 100 pounds each:

Kind of fish.	No. 1.	No. 2.	No. 3.	Ragged.	Rusty.	Sour.	Total.
White fish	54,967	4,766	3,147	373	374	857	64,484
Lake-trout	5,851	264	.....	.....	.....	384	6,499
Cat-fish	128	.....	.....	.....	.....	.....	128
Pickerel	3,095	.....	.....	.....	.....	73	3,168
Lake-herring	16,109	.....	.....	.....	.....	263	16,372
Total	.....	.....	.....	.....	.....	.....	90,651

† White fish, lake-trout and pickerel, (*Stizostedium Americanum*) (Raf.) Cope, come under the term "hard-fish;" cat-fish, if they are skinned, do also, but if not, are "soft-fish."—J. W. M.

This amount (90,651 half-barrels, or 9,065,100 pounds) is simply what has been inspected and packed for shipping. Besides this there were 30,000 half-barrels, or 3,000,000 pounds, in the hands of the dealers at the end of the year that had not been inspected, thus making the amount received by the wholesalers during the year ending December 1, 1875, 12,000,000 pounds in round numbers. The greater part of this amount came from the various fishing-stations around Lake Michigan, and a portion came from Lake Superior and Lake Huron.

The fish is dressed and salted at the fishing-station enough to preserve it until it reaches the market. It is then shipped in boxes by rail or boat. After the fish is received by the dealers, and before it can be repacked, it must be inspected. A few years ago one man was sufficient for this duty, but the trade has increased to such an extent that the head inspector has been compelled to appoint a deputy for each wholesale-house.

The inspector informs me that the trade has increased from 12,000 to 15,000 half-barrels per year for the last five or six years. He also states that the demand greatly exceeds the supply, and that nearly twice the amount obtained could be disposed of.

The fresh-fish trade is also quite extensive. Nearly all the fish caught off Chicago, South Chicago, at Calumet, and various other places near, are sold fresh.

The amount of fresh fish sold yearly in Chicago must equal one-fifth of the quantity used in the wholesale trade. It is impossible to get definite information on this point as the fishermen sell directly to peddlers and retail dealers and no account is kept.

* The classification used in the report referred to, is the one of Sandusky, Ohio, slightly modified so as to conform the statistics of other centers to common terms, by means of which a comparison of the different markets along the lakes is made possible.

C—INVESTMENT AND CHARACTER OF LAKE-FISHERIES AT CHICAGO AND SOUTH CHICAGO.

1.—Fisheries at Chicago.

In the United States Fish Commission Report for 1872–'73, (page 8.) Mr. Milner states that, "At Chicago there were six boats fishing with trot-lines off the mouth of the river, their catch being almost entirely the perch, (*Perca flavescens.*") And just after, "There has been no net fishing here for years, the few experiments made proving failures. It is quite possible, now the filthy current of the river no longer flows into the lake, that there may be some success with nets." The latter conjecture has proven true.

Last season (1875,) three-pound nets were set just off the mouth of the river and were quite successful, the catch in these nets exceeding that of the same number of nets at South Chicago. The largest haul at Chicago was considerably greater than the largest haul at South Chicago.

The investment at Chicago as near as could be determined is as follows:

Three pound-nets, average value $700	$2,100 00
100 boats, average value $65	6,500 00
Set-lines and other material amounting to	1,000 00
	$9,600 00

Investment at South Chicago, 1875:

Twelve pound-nets, average value $700	$8,400 00
Three sail-boats, each $500	1,500 00
Several small boats and nets, seines, &c	800 00
Ice-houses, fish-houses, wagons, and various other material and property belonging strictly to the business	60,000 00
	$70,700 00

Twelve men were employed through the season at this place. Formerly there were four others* working pounds, but they were drowned several years ago and their nets have been removed.

At Chicago instead of the six boats Mr. Milner found there in 1872 fishing with trot-lines, off the mouth of the river, there were, last season, nearly one hundred boats and three hundred men employed in the same business, and three pound-nets. Those using trot-lines and having small unseaworthy boats only go out a mile or two to set their lines and in consequence their catch consists mostly of perch (*Perca americana,*) except in the spring and fall when many "lawyers" (*Lota lacustris*) are taken. The majority of the boats are "mackinaws" or similar boats which are very seaworthy. They run out fifteen or twenty miles and

* The Oemmich brothers, lost in a squall in 1874.—J. W. M.

sometimes farther. Setting their lines which contain from five hundred to one thousand hooks each, baited with minnows before leaving shore, they continue on and run into Michigan City and remain over night. Starting early the next morning they take up their lines and arrive in Chicago during the day. This kind of fishing is carried on until the harbors are frozen over. These lines catch large numbers of sturgeon (*Acipenser rubicundus*) and lake trout (*Salmo namaycush.*) During the spring and fall the lines nearest shore catch quantities of lawyers, sometimes the entire catch being of this species. The lawyers are generally sold to peddlers there being no demand in the markets. Of the other species caught, all except the dog-fish (*Amia calva,*) sheep-head (*Haploidonotus grunniens,*) and gars (*Lepidosteus osseus*) find a ready sale.

While the Chicago River flowed into the lake the water was affected by the filth for some distance along the shore, and was without doubt the cause of the failure of the attempts to institute pound-net fishing there at different times. The current of the river no longer flowing in that direction another trial was made, and last May (1875) three pound-nets were set off the mouth of the river with such good success that the owners feel sanguine of a good harvest next season.

The season was a remarkably poor one all along the Illinois shore. The catch in the two nets off Chicago, which were out the whole season, considerably exceeded that of any two of the nets off South Chicago at the same time, the season at both places commencing in May and ending in July. One of the nets off Chicago was reset in September to try the fall fishing, but the repeated and violent storms which occurred at that season damaged the net to such an extent that it had to be removed.

It is not probable that the fall fishing will amount to much at this end of the lake, owing to the heavy storms which almost invariably visit the lake in the fall, and often for a week or more the water is so rough that it would be impossible to visit the nets. The accompanying diagram* will show the relative position of the nets, with depth of water and length of leaders. The nets are numbered from north to south. The pounds were 28 feet square.

The leaders, as is usual, commenced in shallow water and extended out to the pound in deeper water. Net No. 1 was first set the middle of May off Twenty-seventh street, three miles south of the mouth of the river. The leader commenced in 9 feet of water, about 7 rods from shore and extended out 85 rods to the pound in 18 feet of water. Having poor success, the net was removed the middle of June, and set northeast of north pier, as represented in diagram, net 1. Here the leader commenced at the corner of the pier in 18 feet of water, and extended out 12 rods to the pound, situated in 26 feet of water. The catch here was poor, amounting to $60 for the remainder of the season. Nearly the entire catch here were white-fish (*Coregonus albus*) and lake herrings (*Argyrosomus clupeiformis*).

* See p. 800.

Net 2.—The lead extended from about one-third the length of the government pier north from the south end, out 86 rods. At the pier there were 20 feet of water, and at the pound there were 24 feet. Owing to the meshes of the pound being large the smaller grade of fish escaped, and so lessened the amount of the catch. The fish are graded by the dealers as No. 1, No. 2, or 3, according to size; No. 1 including all those exceeding 1½ pounds in weight, No. 2 including all weighing from ¾ pounds up to 1½ pounds, No. 3 all under ¾ pounds in weight. No. 1 fish are in greatest demand, as they find a readier sale to consumers. In net No. 2 the catch consisted of first and second grade fish, the first grade predominating; there being, according to the owner, at least 900 out of every 1,000 pounds first grade. This net was visited daily when the weather permitted. After the 15th of July the run of white-fish and herring being over, the net did not pay expenses, the catch averaging about 20 pounds of perch (*Perca americana*) per day, with a few chance specimens of cat-fish, buffalo fish, and others. During May and the 1st of June, when the run of white-fish and herring was at its height, but few other species were taken. An occasional lake trout (*Salmo namaycush*), sturgeon (*Acipenser rubicundus*), and a few perch were the principal ones; but as the run commenced to decline the 1st of June the other species began to come in more abundantly, and kept increasing in numbers as the white-fish and herring decreased, until near the 15th of July, when the most of them suddenly left, and scarcely any but perch and occasional stragglers of other species, were taken. The largest haul of white-fish made at one time in this net was during the first week of June. The pound was lifted and 3,000 pounds of fish were removed, and the boat being loaded to the water's edge they were compelled to let the net back, still containing a large number. This haul consisted of large size No. 1 fish. The third net consisted of a long leader with two pounds, one at each end. The two pounds were set about the middle of May. The 1st of June a leader 60 rods long was added, commencing at the outer pound and extending out to 24 feet of water, where a third pound was placed. The two inside pounds were set about one-third of a mile south of the end of the Government pier, one pound being 50 rods inside the pier, and the other 50 rods outside. The inside pound (A) was in 16 feet of water, the next pound (B) in 21 feet of water, and the last pound (C) in 24 feet of water. Pound B in 21 feet of water was the most successful of the three. The haul from this pound often exceeded the amount contained in both the others. The largest catch in B was 2,600 pounds the first week in June, and varied from that to 100 pounds daily until the 1st of July. In the inside pound (A) the maximum was 200 pounds, and the average for the season nearly 100 pounds daily. For the next pound, (B,) as just stated, the maximum was 2,600 pounds, and the daily average 1,000 pounds. In the outside pound (C) the maximum was 1,000 pounds, and the daily average from 300 to 400 pounds. The principal obstacle to successful

pound net-fishing here at present seems to be the danger the nets are in from the numerous tug-boats and propellers which are continually crossing and re-crossing the harbor in every direction. Last season, through carelessness and in fogs, the leader on No. 3 was badly damaged several times, once about 80 rods being carried away and destroyed by the wheel of a tug catching in the net as it passed over. In September the herring commenced running again, and were abundant for three weeks, when they again disappeared. At the middle of September 80 rods of lead net and pound B were placed out again, but severe storms came on and destroyed the lead and damaged the pound so it had to be taken up. At this end of the lake white-fish seem to frequent the vicinity of the mouth of a river while near shore, and sturgeon to prefer the shore at a distance from a river. In proof of this I have gained the following facts from the fishermen: At Evanston, Ills., 12 miles north of Chicago, Mr. Lawson, owner of the pound net formerly set there, tells me that during several years fishing he only caught a few white-fish until within the last two years, when they became more plentiful than before. Could the filth from Chicago River by means of a lake current have affected the fish at such a distance? The net at Evanston was situated nearly a mile from shore, in 24 feet of water. At Lake View, 6 miles north of the Chicago River, seining is done in spring and fall, the catch being almost exclusively sturgeon, which are placed in a lagoon a few rods back from the lake-shore, and large numbers are kept alive until disposed of to the market-men. Occasionally a good haul of perch and herring is made, but this is of rare occurrence in the case of the herring. At South Chicago the pounds nearest the mouth of Calumet River take much larger quantities of white-fish than those at a distance. As the distance the net is from the river increases, the quantity of white-fish taken decreases, and the amount of sturgeon taken increases.

2.—FISHERIES AT SOUTH CHICAGO.

There are twelve pound-nets at this place, ten of which were in use last season, (1875). The first net was situated a little to the northeast from the mouth of the Calumet River, and the others were scattered along the lake shore east for about 10 miles. They are situated in from 26 to 31 feet of water, the length of the piles used determining the depth. The leaders are from 75 to 80 rods long. Their distance from shore is dependent upon the depth of the water and varies from one-half a mile to a mile. The season for white-fish generally commences here the 1st of May, occasionally opening several weeks sooner, and commencing one year as early as March. Formerly there were good fall seasons and large quantities of white-fish, herring, and sturgeon were taken, but during the last few years the falls have been so stormy that it has entirely prevented any fall net-fishing whatever.

The white-fish seasons are quite irregular; some years extending from the 1st of May to the middle of July, and not coming in shore in

the fall; again there are two seasons, one commencing in April and ending in June, and a second season commencing in September and ending in November or December.

Some seining is done at the mouth of the river during the summer, when some species—principally the white-bass *Roccus chrysops*, crowd up into the mouth of the river in large numbers.

All the marketable fish taken at this place are dressed and sent to Chicago, 12 miles, in wagons. They generally find a ready market; at times when there is a large run of fish all along the shore, the market is filled and they bring a very low price, selling for from 1 to 6 cents per pound, according to kind and quality.

The net owner at this place said that when a large run occurs in warm weather, the most of the fishermen hurry their entire catch into the market the first day and supplying the demand, the fish which are taken the remainder of the run bring a price so low that it does not pay the expense of getting them into market, and large quantities are allowed to spoil. The only way to avoid the difficulty would be to take only enough fish from the pounds to supply the demand, and in this way keep the prices uniform, and avoid uselessly destroying large numbers of fish.

D—LISTS OF SPECIES TAKEN AT CHICAGO AND FISHING IN ADJACENT REGIONS.

Although Mr. Milner wrote up the habits and distribution of the lake fishes so thoroughly in his report for 1871–1872, I have thought that some additional facts regarding the species which have come under my observation may be of value, and so note them here.

For comparison I have made separate lists of the species found at Chicago and those at South Chicago, as many of the species which are abundant at one place are comparatively rare at the other, and vice-versa.

1.—CHICAGO FOR SPRING SEASON OF 1875.

Lota lacustris, (Walb.);* lawyer; eel pout—Common during first half of the season; towards the last half of the season they became quite rare. This species is never taken in large numbers from the pound, but many are taken on the set-lines a few miles out and is occasionally caught from the piers with hook and line.

Haploidonotus grunniens, Raf.; sheephead—A common species in the summer. Quite often taken with hook and line from the piers. It appears to be very irregular in its occurrence, some days not a single one being taken from the pounds, and the next day there are from 50 to 100 pounds in each net; after being abundant for a day or two they entirely disappear for several days.

Micropterus pallidus, (Cuv. and Val.;) black bass.—Very rare; one or two taken in the pound during the first of the season.

* The nomenclature of the species in this paper, in Mr. Nelson's absence, has been revised by Prof. D. S. Jordan.—J. W. M.

Ambloplites rupestris, (Raf.,) Gill; rock bass.—Rare; taken with the preceding; sometimes caught with hook from the piers.

Lepomis pallidus and *Eupomotis aureus;* sunfish.—Taken in small numbers throughout the season.

Perca americana, Schrank; yellow perch.—Common throughout the season, averaging 20 pounds daily. Taken in varying numbers from the piers all summer. The fishermen say they do not follow the leader well, so are not taken in large quantities as they would otherwise be.

Stizostethium vitreum, Cuv. and Val.; wall-eyed pike.—Common. A few taken daily until the 1st of July.

Roccus chrysops, (Raf.) Gill.; white bass.—The first taken the first of July, after which it became quite common, but no large quantities were taken. The quantity varied from 10 to 50 pounds daily during July.

Esox lucius, Lin.; lake pike.—Very rare in the pounds south of the pier. One specimen was taken in net 3, pound B, just before the nets were removed in July. In net No. 2, just north of this, they were abundant, quite a number being taken daily. The only reason for this is that they must have all been moving south parallel to the shore, and so been stopped by the first leader. If this was the case they must swim in a limited path, for none were taken in net No. 1, which was a little farther in shore and situated north of this net.

Umbra limi, (Kirt) Günth.; mud-minnow.—In the fall and spring this species frequents the vicinity of the piers in large schools, and quantities are caught in dip-nets to use for bait on the set lines. During the summer they are very rarely seen near shore. The day succeeding severe storms in the summer they congregate in a dense mass inside the pound, and as it was slowly lifted would follow it to the surface. At the first splash they dart through the meshes of the net, and disappear as though by magic.

Coregonus albus, Les.; white-fish.—This species commences running the first of May, and the season is at its height the last of this month. From the first week in June they gradually decrease in numbers until the middle of July, when only a few stragglers are taken. The largest quantity taken at this end of the lake last season, and from one net, was obtained the first week in June, from net No. 3, and amounted to over three hundred pounds in one day. Hard storms, which cause the water near shore to become muddy or full of sand, drive this species into deeper water; but as soon as the water clears they return. When driven into deep water by a storm the first of July they do not return, and the fishermen say it is useless to leave the nets out after a storm at this time of year.

Argyrosomus clupeiformis, Mitch.; lake herring.—This species commenced running shortly after the white-fish began, and continued to run with the white-fish until the close of the season. The first of June, when the may-flies (*Ephemeræ*) swarm along the lake shore, the herrings come in close to the pier for the purpose of eating the insects which fall into the

water. At this time large numbers of them are caught by baiting hooks with these flies. They are occasionally caught from the piers at other times with a minnow for bait.

Salmo namaycush, Rich.; lake trout.—Commences running the middle of April, as they are taken at that time with set-lines a short distance out from shore, and a few are taken with a seine at Lake View about the same time. They are taken on the set-lines several miles off shore through the season. They were quite rare in the pounds.

Myxostoma macrolepidota (Les.) Jordan; mullet.—During the first of the season they were not common. After July 1 they were more plentiful, there being on an average twenty-five specimens taken daily, some days as many as fifty being taken. They are in good demand in the markets.

Catostomus commersonii, (Lac.) Jor.—This and two or three other species of suckers were taken in sparing numbers through the season. They were most abundant with the eel pouts in the spring, sometimes there being fifty pounds in the net at a time.

Bubalichthys bubalus; buffalo fish.—Rare. One taken the last of May and two or three the first of July.

Amiurus catus, Lin.; bullhead.—Sometimes taken with the hook along the break-waters.

Ichthælurus punctatus, Raf.; forked-tail cat.—Very rare. Two specimens taken just before the net was removed in July. This species, with *Amiurus nigricans*, is often taken on the set-lines farther out.

Amia calva Lin.; dog-fish.—Quite rare. Single specimens taken at intervals.

Lepidosteus osseous Lin.; gar pike.—Rare; sometimes taken on the set-lines.

Acipenser rubicundus Les.; sturgeon.—Not common; about a dozen specimens taken in all the pounds during the season. Three was the largest number taken in one day. A great many are taken with set-lines about 15 miles off shore, principally in the fall and spring. This mode of fishing is necessarily suspended during the months of July and August, owing to the lack of bait, the minnows keeping out in deep water and are too shy to be taken by the dip-nets.

Petromyzon, Lin.; lamprey.—This fish is frequently taken with the sturgeon.

2.—SPECIES TAKEN AT SOUTH CHICAGO.

Lota lacustris (Walb.;) lawyer.—Taken in varying numbers through the season. Very abundant in the spring.

Haploidonotus grunniens Raf.; sheep-head.—Much more abundant than near Chicago. They commence running about the first of June, and are taken in large numbers the remainder of the season. In July, 1873, a large run occurred, and in one day over 10,000 pounds were taken. Since then, their numbers have decreased. There is no demand for this fish in the market.*

* This species, though condemned by many who have eaten it, has a demand growing for it, especially eastward.—J. W. M.

Micropterus pallidus (Cuv. and Val.;) black bass.—More abundant than near Chicago. A few taken daily.

Ambloplites rupestris (Raf.,) Gill; rock bass.—Common.

Perca Americanus Schranck; perch.—Common in the pounds; taken throughout the season. Large numbers are taken with the seine and gill-net at the mouth of the Calumet in the fall.

Roccus chrysops (Raf.) Gill; white bass.—As the weather gets warm in June, on pleasant evenings this species crowd in the mouth of the river so that the water appears to be filled with a compact mass. One haul with a long seine at one of these runs, it was estimated, contained over 20,000 pounds, the most of which were turned back into the river. It is only during calm pleasant weather, with a south wind for several days in succession, that these large runs occur; but every season they are more or less abundant. They are not in good demand as a market fish, so but little effort is made to catch them. When the large runs occur they often go up the river as far as Calumet Lake, ten miles, and a few remain in this lake throughout the year, being taken whenever the fisherman do any seining there.

Esox lucius, Lin.; lake pike. Occasionally taken in the pounds.

Esox nobilior, Thomp.; muskellonge.—This species occurs in the pounds in sparing numbers throughout the season.

Coregonus albus, Les.; White fish.—Formerly this species spawned a short distance off-shore in large numbers, but it has been several years since. May and June are the principal months for this fish unless as sometimes occurs there is a fall run, when they are abundant from the last of September to the first of December.

Argyrosomus clupeiformis, Mitch.; lake herring.—Runs with the preceding and in nearly equal numbers. The catch of this and the preceding species varies from 800 to 10,000 pounds, daily, the average being about 1,500 pounds of the two kinds.

Salmo namayacush, Rich.; lake trout.—Common during the spring and fall seasons.

Myxostoma macrolepidota, Les.; mullet.—Common in the spring. This species, *C. commersonii*, and several other species of suckers, are taken in varying numbers through the season.

Bubalichthys bubalus, buffalo fish.—Common in the pounds throughout the season. Sometimes several hundred weight are taken in a day.

Amiurus catus, Lin.; bullhead.—Occasionally taken in the pounds.

Amiurus nigricans, Les.; lake catfish, and *Ictheelurus punctatus*, Raf.; forked-tail catfish.—Both species are abundant. Several hundred weight of the two are often taken in a day, during the last of the season. Specimens of the fish are often taken that weigh 50 pounds, each. The latter average much less and are a slenderer fish.

Amia calva, Lin.; dogfish.—Not common in the pounds. Often taken by the seines near shore. They swarm in the water about the fish houses near the mouth of the river where the offal is thrown.

Lepidostens osseus, Lin.; gar pike.—Occasionally taken.

Acipenser rubicundus, Les.; sturgeon.—Very abundant. Commence running the first of May and continue all through the warm weather. This species is sometimes taken in the seine. They occasionally stray in the Calumet river and specimens have been taken 18 miles from its mouth. The largest haul of this species ever taken amounted to 8000 pounds of dressed fish.

3.—CALUMET RIVER AND LAKE.

At present there is very little fishing done throughout the course of the Calumet River. A few men earn a scanty subsistence by using small gill-nets in the numerous sloughs and bays extending off from the main channel a few miles above the mouth, together with the seining at the mouth of the river and in Calumet Lake. During the fall and spring the fishermen work the pound-nets off South Chicago, besides gill and hoop-nets 15 miles above the mouth, which includes all the regular fishing.

About ten years ago this stream contained large numbers of pickerel and black bass, and in consequence was a favorite resort for anglers from Chicago. Within the last five years, however, these fish have decreased in numbers so rapidly that at present a person might troll for several days without getting a fish. There are, however, a few favored localities on the Little Calumet where these species may still be taken. The seining at the mouth of the river is for lake species, which run in during the spring and summer. The fish caught in the gill-nets are obtained by setting the net across the mouth of a slough opening into the river. The fishermen row to the farther end and return splashing the water and pushing a long pole into the weeds, in order to frighten the fish into the net. Perch and dog-fish are the principal fish taken in this manner, but a few pickerel, black bass and rock bass, are also taken. When a strong north wind prevails for several days the lake water gradually forces the river water back, and sometimes the lake water extends up the river 12 miles from its mouth. The waters are so entirely different in color and temperature that they can be recognized at once. The lake water has a greenish tint and is much colder, while the river water has a dark-brownish color and is quite warm. As the lake water gradually ascends the channel the river fish retreat, and in a day or two lake fish take their places. When the wind stops blowing the lake water gradually flows back, the lake fish going with it, and the river fish return. This is noticed by every one who fishes with hook and line in the river within a few miles of the mouth. When there is a strong north wind and the water in the river is a pale-greenish color the perch taken are all of the white variety, only found in the lake water, called lake perch; but if the wind is in any other direction the river water is dark-brownish, and only the dark-yellow variety, found only in the river, called river perch, are caught. The only connection between Calumet

River and Calumet Lake is a small channel at the north end of the lake. This channel was originally made by the Indians as a communication between the river and the lake during their hunting and fishing excursions.

Old residents tell me that at first this channel was barely wide enough to allow the passage of canoes, but has gradually enlarged to its present dimensions, being one-quarter of a mile in length, about 50 feet wide, and 6 to 8 feet in depth. The lake is merely a sink, into which the water from the surrounding marshes and sloughs empties and forms a body of water about 3 miles long and 2 miles wide, and an average depth of from 4 to 6 feet of water, with a deeper channel extending lengthwise through the lake north and south. The shores are boggy and covered with a growth of wild rice (*Zizania aquatica*). The bottom of the lake is covered with a layer of mud. While seining in this lake the fishermen have caught many species that are ordinarily only taken in Lake Michigan. Their theory is that these fish have followed the river up to the channel, during some northerly storm, and straying through this into the lake have been unable to find their way out again. Some of these species exist in this lake in large numbers, and without doubt breed there. It is generally supposed that there are but few fish in this lake; yet the fishermen who seine there say that there are large numbers of fishes in it.

Some species rare in the river at present, are abundant in the lake. The following species are enumerated by the fishermen as being taken in Calumet Lake:

The eel pout is abundant; not known to be taken in the river except at intervals.

Black bass; formerly very abundant in the river, but now rare; quite abundant in Calumet Lake at present.

Rock bass; in river and lake.

Perch; common in river and lake.

White bass; common in the lake; only found in the river at intervals.

Pickerel; quite rare at present in the river and common in the lake.

Mullet sucker; plentiful in the lake; not often taken in the river. Several other species of suckers are also taken, which have not been determined.

Buffalo fish; very plentiful in the lake; generally rare in the river.

Bullhead; exceedingly abundant in the lake. January 13, 1876, some fishermen with a seine obtained over 3,000 pounds of this species, in a bay at one end of this lake.

Lake catfish (*Amiurus nigricans*); common in the lake and river.

Dogfish; abundant in both river and lake.

Gar pike; not uncommon in river and lake.

Sturgeon; have been occasionally taken, and are said to be quite common.

Lampreys; are also taken.

4.—RIVERDALE, ILL.

At this place the fisherman has netted with hoop and gill nets for nine years. The fyke-net is placed on one side of the Calumet River with the opening down stream, the arms running out 12 feet on each side. The gill-net is stretched across the river. At Riverdale there is a large distillery from which the slops are conducted into the river, and this affects the water so that a sour odor is very apparent for 6 or 8 miles below. The decrease in the number of fishes in the river is, without doubt, owing in part to this cause, as no fishes can be caught during the summer and fall for several miles below the distillery, while a short distance above, perch, sunfish, and several other species, are common. In proof of the destructive effect of this waste from the distillery I have the following notes of a remarkable run of fish I chanced to witness last winter (1875) and the effect of the water upon the fish above and below Riverdale. January 27, 1875, being at Riverdale and hearing several persons speaking of the large number of fish they were catching at the river, I went down to the ground. Owing to the severe cold weather the ice on the river was 20 inches thick, by measurement. The only openings, to my knowledge, in the ice throughout the course of this branch of the river were at Riverdale and Blue Island, 8 miles farther up the stream. At the former place there were two openings, one made by the ice-cutters, and the other, about 10 feet across, caused by the warm water from an artesian well flowing into the river near the distillery. At Blue Island the opening was caused by the rapid current flowing over the remains of a dam. On reaching the bank of the river I saw a group of men and boys surrounding the openings, which were about 200 yards apart. They were armed with shovels, pitchforks, muskrat-spears, dip-nets, and indeed any implements that could be used in throwing or pulling the fish out of the water. Joining one of these groups I was astonished to find the water filled with a struggling mass of fishes, all striving to get their noses to the surface of the water. As among these there were many large-sized fish, many of the smaller fry were lifted from the water, and where the new ice had commenced to form about the edges of the opening there was a solid layer of small perch and bullheads crowded out in this manner. On the ice, to one side of the hole, was a pile of buffalo-fish, large perch, bullheads, a few pickerel and black bass, which had been caught by one man with a dip-net. When he removed them, there were two one-horse wagon-loads, amounting to over 2,500 pounds. Scattered about on the ice were hundreds of fishes not edible. Garpike (*Lepidosteus osseus*) were especially numerous. I counted over two hundred and seemed no nearer the end than when I had commenced. They varied from 12 inches to 3½ feet in length. With them were a nearly equal number of dog-fish. Examing the large pile of fish, I found perch, buffalo-fish, lake cat-fish, bullheads, and rock-bass were the most numerous species, the buffalo-

fish predominating. The latter weighed from 10 to 30 pounds. Black bass, white bass, and pickerel were not common, only a few being taken. These fish were all taken below the distillery and were very stupid. I saw a man throw out a number of dog-fish and garpike by putting the tines of his fork under them and giving a toss land them on the ice, where they lay with scarcely a struggle.

The next day I was at Blue Island, and there they were having a very similar run, with the exception that the fish were much livelier here than at Riverdale. Although the same species were taken and in about equal numbers as at the latter place, yet they could only be taken as they tried to crowd up to the surface of the shallow water running over the site of the old dam. This gave the fishermen an advantage, and when thrown on to the ice the fish struggled and flapped about, showing all their natural vigor. This run continued for several days at both places, and fishermen who were there during the whole run assured me that there must have been several tons taken from each place. In the shallow water at the Blue Island dam when the fish were crowding up in the largest numbers, the mass was so dense they were shovelled out onto the ice. After the ice had thawed in the spring and the river fallen several feet the effect of the waste from the distillery was much more evident than before. While collecting birds along the river below the distillery I found thousands of dead fish lying along the bank. In some places they formed a layer several inches deep, and in others lay scattered along the bank irregularly on each side of the river. The banks were strown with dead fish for at least 5 miles below Riverdale. Above this place toward Blue Island an occasional fish was found, not more than twenty or thirty in a mile. The fishermen on the river are also of the opinion that the fish are killed by the refuse from the distillery.

From a fisherman living just above the distillery at Riverdale, I have the following notes regarding the fish caught there in the last nine years. The species mentioned are only the prominent ones which he has taken; probably many small species are taken that he does not know or has no name for.

Lota lacustris, eel pout; occasionally taken in winter.

Haploidonotus grunniens, sheephead; not over 50 pounds have been taken in nine years.

Micropterus pallidus, black bass; taken irregularly at present, formerly abundant.

Ambloplites rupestris, rock bass; taken in sparing numbers throughout the year.

Eupomotis aureus and *Lepomis pallidus*, sun-fish; very common throughout the year.

Perca americana, yellow perch; abundant, from 100 to 300 pounds taken daily.

Stizostethium vitreum, pike; in the spring of 1875 quite a large run

of this species occurred, and over 200 pounds were taken in a day. Previous to this date and since then, only occasional specimens have been taken.

Roccus chrysops, white bass; a few taken every summer.

Esox lucius, pickerel; formerly abundant; quite rare now.

Myxostoma aureola, mullet; occasional during summer.

Catostomus commersonii, common suckers; abundant at all seasons; sometimes as many as 800 pounds are taken daily in the fall.

Myxostoma macrolepidota, red horse; rare; occasionally a specimen is taken in the gill-net.

Bubalichthys bubalus, buffalo-fish; only taken in the seine in spring and fall.

Amiurus catus, bull-head; common at all seasons.

Amiurus nigricans, catfish; specimens taken at short intervals during the spring.

Amia calva, dogfish; very abundant during the entire year.

Lepidosteus osseus, gar pike; this species is occasionally taken at all seasons.

One fall, several years since, over 200 gars were taken from the hoop-net in one day. During his nine years' fishing, the Riverdale fisherman tells me he has taken about a dozen eels; they have generally occurred in the spring or fall.

The only evidence as yet of the success of the attempt to stock the Calumet with eels and shad, made by Mr. Milner in 1872, was the capture of a small shad 3 or 4 inches in length. This specimen was caught in a hoop-net at Riverdale, April, 1874.

A small portion of the number of fishes Mr. Milner brought to the Calumet, were placed in the river near Riverdale, but the majority were placed nearer the mouth of the river. Without doubt, such of the young fish as were below the distillery, were killed by the filthy condition of the water. Probably those that have remained above are still living, and should an attempt be made to obtain specimens there, it would very likely prove successful. Should the young of these species be placed in Calumet Lake, they would doubtless thrive, and in time might stock the river. They would at least be shielded from the effect of the impurities of the river water, and as the water in the lake is naturally as pure as that in the river, both coming from the same source, the fish would have a much better chance in the "struggle for existence."

5.—ILLINOIS RIVER AND TRIBUTARIES.

As the character of the fishing at Lemont and Lockport is the same as at Joliet, and I have a more complete account of the subject at the latter place, I will let my notes on the fishing at Joliet and the list of species, unless otherwise stated, apply to both these places. Joliet is situated upon the Desplaines River, which empties into the Kankakee River a few miles below this town, and the Kankakee finally empties into the Illinois River.

At Seneca, a short distance below the junction of the Kankakee and Desplaines River, there is a dam which prevents any large number of fishes from coming up the river above that point. This combined with the effect of the Chicago River water, will doubtless eventually depopulate the rivers above that place. Before the waters of Chicago River were turned through the canal into the Desplaines, and from this into the Kankakee and Illinois rivers, there was fine fishing at nearly every point along these rivers, and in the smaller tributaries of each.

Previously to the opening of the Chicago River into the canal in 1871, rock-bass, (*Ambloplites rupestris*); black-bass, (*Micropterus pallidus*); silver bass, (*Roccus chrysops*); wall-eyed pike, (*Stizostethium vitreum*); mud-pike, (?); pickerel, (*Esoxlucius*); mud-eel, (?); silver-eel, (*Anguilla rostrata*); buffalo fish, (*Bubalichthys bubalus*); red horse, *Myxostoma macrolepidota*); suckers, *Catostomus* ——— ?); bull-heads, (*Amiurus catus*); spoon-fish, or shovel-bill, (*Polyodon folium*); sun-fish, (*Pomotis* ——— ?); cat-fish, *Amiurus* ——— ?); dog-fish, (*Amia calva*); gar pike, (*Lepidosteus osseus*); perch, (*Perca americana*), were caught in both these rivers, and also in the Du Page River, which flows 6 miles east of Joliet, and empties into the Desplaines 8 miles south of that town; also in Hickory Creek which rises about 14 miles east of Joliet, and empties into the Desplaines just south of the town, and in any of the streams of sufficient size in this vicinity.

When the current of Chicago River was first turned through the canal and the rivers, it caused the fish in them to bloat to a large size, and rising to the surface they floated down the stream in large numbers. It was estimated at the time that several tons of dead fish passed through one of the canal-locks just after the foul water commenced running through the canal.

When these bloated fish chanced to float into the clear water at the mouth of some tributary of the river they would revive and swim up the clear stream. Such large numbers of the fish revived in this manner that all the small streams flowing into the Desplaines and Kankaku rivers were filled with fish in such numbers that many were taken with hook and line, one man taking over 300 in a day in this manner at that time.

When the spring freshets occur the current is so rapid and the amount of pure water in the river is so great, that the foul water does not have much effect upon the fishes, and large numbers of the species mentioned ascend the rivers and are caught with hook and line. Later in the season as the water subsides, and the water from Chicago River predominates, the fish which came up in the spring die and are floated down the river. In July and August when the water is the worst even the mud turtles leave the river in disgust and seek less odorous homes.

Dog-fish are the last to die. Next to this species the bull-head, (*Amiurus catus*), are the longest lived, but finally they succumb and are floated down like their predecessors.

Before the current of the Chicago River was turned in this direction, some seining was done and dip-nets were used.

A species of minnow is said to spawn in great abundance at the mouth of a creek emptying into the Desplaines just north of Joliet, and when the muddy water flows over the spawn it is destroyed.

There are no professional fishermen at Joliet. A few men occasionally spending a short time fishing for market during spring and fall. Formerly they fished in the Desplaines, but at present only in the Kankakee above the mouth of the former river.

Around Joliet Lake, 3 miles southwest of Joliet, there are a number of springs; during the cold weather in the winter the fish of the lake congregate in the water about these springs.

People from the town and surrounding country go there and catch any number desired, as the openings in the ice caused by the warmer water of the springs are literally filled with fish of all the species found in the lake, the species here being the same as in the river.

The fish obtained in this lake are not generally considered edible. Eels have always been rare in the rivers in this vicinity, only about a dozen being taken yearly.

A party who has fished at Joliet upwards of twenty years states that thirteen years ago a large number of sheep-head (*Haploidonotus grunniens*), were taken in the spring and that none have been known to occur since.

Since the water of the river has been impure none of the fishes taken in the Desplaines and its tributaries are considered good for food, and the local demand for fresh fish is mostly supplied from Chicago, a small portion coming from the Kankakee River several miles above its junction with the Desplaines.

6.—LIST OF SPECIES IN THE ILLINOIS RIVER IN THE VICINITY OF PEORIA.

The following imperfect list of species is copied from the History of Peoria by C. Ballance:

As several species are mentioned not recorded in the Kankakee or Desplaines, I here insert the list: *Perca flavescens*, yellow perch; *Centrarchus fasciatus*, black bass; *Pomotis vulgaris*, sun-fish; *Pimælodus catus*, cat-fish; *Lenciscus deplema*, horned dace; *Catostomus tuberculatus*, warted sucker; *Catostomus duquesnii*, red-horse; *Esox estor*, pike; *Lepidosteus*, gar; *Anguilla lutea*, eel; *Acipenser*, sturgeon; *Polyodon folium*, shovel-fish, and several specimens not identified.

An exploration of the various streams and lakes in this State will without doubt reveal many species not anticipated, and probably a number new to science.

From the effect of the Chicago River water upon the fishes in the streams through which it passes before reaching the Mississippi River and the effect of the distillery on the water and fishes in the Little Cal-

umet, it will probably be useless to introduce new food-fishes. But other streams, and the numerous lakes in this part of the State can be successfully restocked. Eels would without doubt succeed, and the finding of the small shad at Riverdale proves that they have lived for a few years in that stream.

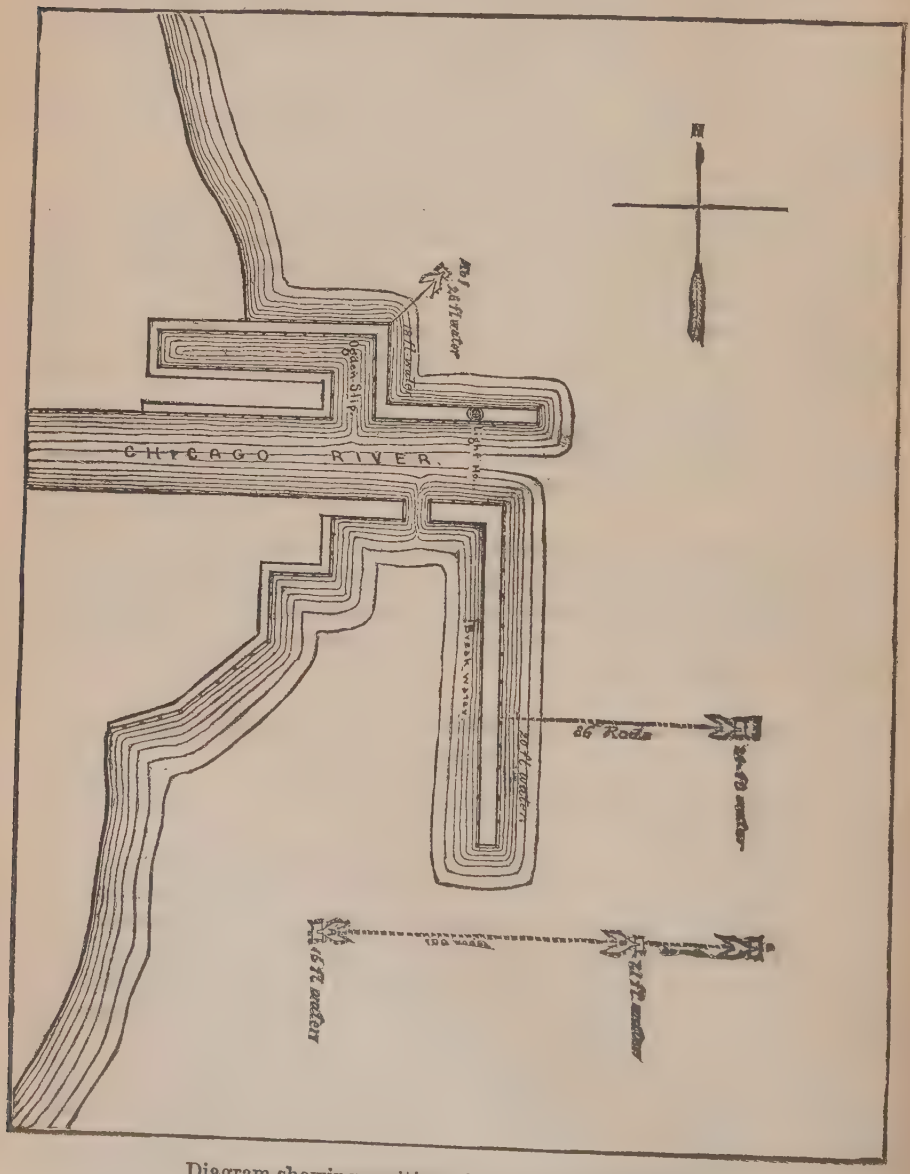

Diagram showing position of nets in Chicago Harbor.

III.—THE SALMON FISHERIES OF THE COLUMBIA RIVER.

By Livingston Stone.

San Francisco, Cal., *December* 31, 1875.

Sir: I beg leave to report as follows:

In pursuance of instructions received from you from Washington, I left San Francisco for the Columbia River on the 1st day of May, 1875, and arrived at Portland, Oreg., on the 6th day of the same month. From this point I made various excursions up the Willamette and up and down the Columbia from the ocean to Celilo, 210 miles from the mouth of the river, giving special attention to the natural history of the salmon and the business of the river canneries, besides looking up a favorable point for the artificial propagation of salmon.

In regard to the natural history of the salmon I was able to gather quite a large number of facts, but could make only very little certain progress, in the limited time that I had to spend on the Columbia, toward determining the number and characteristics of the many varieties of salmon which frequent the river.

The facts which I collected in regard to the natural history of the salmon, together with the other results of my investigations, will be found in the course of the following report.

LIVINGSTON STONE.

Prof. Spencer F. Baird,
United States Commissioner of Fish and Fisheries.

A—THE COLUMBIA RIVER.

The Columbia, as is generally known, is the most productive salmon river of the world. Its vast tributaries, extending over many degrees of latitude and longitude, furnish immense spawning-grounds for the accommodation of the parent fish, while the broad and deep channel of the main stream for hundreds of miles affords a magnificent highway, free of obstruction, for their easy ascent of the river.

These advantages the salmon have availed themselves of in an extraordinary degree, and they pour through the mouth of the Columbia and up its current in an abundance unknown to any other river in the inhabited portions of the globe.

The abundance of the salmon, however, is not their only peculiarity in this wonderful river. They occur in greater variety also than in any other known river of the world.

While there is only one anadromous salmon in the Sacramento, one in the Penobscot, one in the Miramichi, one in the Rhine, and one in the British rivers, there are said to be no less than twelve distinct varieties in the Columbia. These in all their Protean forms, occasioned by differences of age, season, and sex, have constituted a labyrinth which has always been an invincible puzzle to naturalists.

In the very brief time that I spent on the Columbia it was quite impossible to acquire anything like an exhaustive knowledge of the different varieties in the river. I consequently confined myself chiefly to inquiries into the characteristics of the Chinook salmon (*Salmo quinnat*), which I had an opportunity to see and study, and to gathering such information as I could regarding the other kinds, from the fishermen and other salmon-experts of the river.

The results of my investigation in regard to the *Salmo quinnat* will be found in the form of answers to Professor Baird's very valuable series of questions relating to fishes.

B—QUESTIONS RELATIVE TO THE FOOD-FISHES.—SALMO QUINNAT.

1.—Name.

Question. What is the name by which this fish is known in your neighborhood? If possible make an outline sketch for better identification.

Answer. This fish is known in the Columbia River as the "Chinook salmon," the "Tyee salmon," and the "common salmon of the Columbia."

2.—Distribution.

Question. Is it found throughout the year, or only during a certain time; and for what time?

Answer. The Chinook salmon are not found in the main Columbia throughout the year, but begin to enter the river in February and continue to run until some time in September.

Question. If resident, is it more abundant at certain times of the year, and at what times?

Answer. They are most abundant from April to August, the greatest number making their appearance in the month of July.

3.—Abundance.

Question. How abundant is it, compared with other fish?

Answer. They vastly exceed in abundance any other fish of the river.

Question. Has the abundance of the fish diminished or increased within the last ten years, or is it about the same?

Answer. The salmon have not increased in the Columbia River during the last ten years, and it is not known that they have diminished any. Fewer Chinook salmon now make their appearance in the upper rivers, but this is sufficiently accounted for by the fact that such a vast quantity are now netted in the main river on their way up. On the Willamette River the fishermen claim that the salmon have very much diminished, and that they caught only twenty or thirty now where they used to catch a hundred. This is undoubtedly true, but it does not prove that the salmon of the Columbia are diminishing, for it may be, and probably is, only the natural result of so many thousand more being stopped and caught in the main river below than there used to be. This must, of course, lessen the number that enter the Willamette.

Question. If diminished or increased, what is the supposed cause?

Answer.

Question. What is the amount, or extent, of the change in abundance?

Answer.

4.—Size.

Question. What is the greatest size to which it attains (both length and weight), and what the average?

Answer. The largest specimen that I ever saw weighed had a length of 35 inches, a girth of 31 inches, and a weight of 65½ pounds. One of the fishermen told me that he saw one caught in May, 1843, which weighed 83 pounds. This is the largest Columbia River salmon that I have heard of. The average weight is 22 or 23 pounds whole, and 16¾ or 17 pounds dressed. Out of 98,000 salmon taken at Clifton, Oreg., in 1874, only one weighed as much as 65 pounds.

Question. State the rate of growth per annum, if known, and the size at one, two, three, or more years.

Answer. The rate of growth is not known. There is every reason to believe, however, that it is similar to that of the Sacramento salmon. (See Report of United States Commissioner of Fish and Fisheries, 1872–'73, pp. 185, 186.)

Question. Do the sexes differ in respect to shape, size, rate of growth, &c.?

Answer. In the spring the sexes are exactly alike in appearance. At and near the spawning-season they differ very much. Their rate of growth appears to be nearly the same.

5.—Migrations and movements.

Question. By what route do these fish come in to the shore, and what the subsequent movements?

Answer. It is not known by what route they come in to the shore, though it is conjectured that they come chiefly from the north. After entering the river the spring runs gradually make their way up toward the upper tributaries. The summer runs proceed more rapidly, a large proportion of both reaching the very headwaters of the river. The fall run of salmon do not ascend so high, but frequently spawn on the sand-beds of the main river within 50 miles of the sea. The salmon do not follow a stated track every year in ascending the river, but one year they take one course and another year a different one. Neither do they adhere to the same course during any specified year, but sometimes ascend the current and sometimes keep near the banks. A very strong current, however, they seem in the lower river to uniformly avoid.

Question. By what route do they leave the coast?

Answer. Not known.

Question. Where do they spend the winter season?

Answer. In the ocean.

Question. When are the fish first seen or known to come near the shore, and when does the main body arrive? Are the first the largest? Are there more schools or runs than one coming in, and at what intervals?

Answer. The salmon make their first appearance in February, though in very small numbers. The main body arrives in May, June, and especially in July, when the run is enormous. The May salmon are largest. Perhaps the most correct view to take of the running of the salmon is to consider all the salmon as included in one run, beginning in February, increasing in May and June, and culminating in July though they might also be legitimately divided into three runs: the first or meager run coming in February, March, and April, the second or full run in May and June, and the third or maximum run in July. After July they diminish very rapidly, and soon almost entirely disappear from the river.

Question. When do the fish leave shore, and is this done by degrees or in a body?

Answer. Those that do not die in the upper waters leave shore after descending the river, probably by degrees.

Question. Is the appearance of the fish on the coast regular and certain, or do they ever fail for one or more seasons at a time and then return in greater or less abundance? If so, to what cause is this assigned?

Answer. The appearance of the fish on the coast and in the river is very regular and certain. They never fail. This is the testimony of the Hudson's Bay Company for over a hundred years.

Question. How do the runs differ from each other in number and size?

Answer. See answer to question, When are the fish first seen? &c.

Question. Which sex comes in first; and how far advanced is the spawn in the female on first arriving?

Answer. Males and females come in together. Possibly the males somewhat precede. The spawn in the females is very backward when the first run enters the river; when the latter runs enter the river, it is well developed.

Question. Will either sex, or both, take the hook on first arriving; and if so, is there any period of the stay of fish when they refuse it?

Answer. Both sexes will take the hook when first arriving from the sea, and continue to till they enter fresh water. After this they refuse the hook till they reach the upper tributaries of the river, when they take the hook again quite eagerly.

Question. If they refuse the hook at first, how soon do they begin to take it after arriving?

Answer. See answer to the previous question.

Question. Do the schools of fish swim high or low; and is their arrival known otherwise than by their capture; that is, do they make a ripple on the water; do they attract birds, &c.?

Answer. They sometimes swim high and sometimes low. Their arrival is not marked by any signs above the surface of the water, except when they arrive at the upper waters, when they make their presence known by their incessant jumping.

Question. What is the relation of their movements to the ebb and flow of the tide?

Answer. In tide-waters the salmon are always found heading toward the tide; that is, up-stream with an ebb-tide, and down-stream with a flood-tide.

Question. Does spawn ever run out of these fish taken with a hook?

Answer. Yes.

Question. Answer same question in regard to fish taken in nets or pounds; is the spawn ever seen in any quantity floating about inside of nets?

Answer. Salmon are often taken at the spawning-season in nets, and otherwise, with the spawn flowing from them.

Question. Are these fish anadromous; that is, do they run up from the sea into fresh water for any, and for what, purpose?

Answer. Certainly. They come up to deposit their spawn.

Question. If anadromous, when are they first seen off the coast; when do they enter the mouths of the rivers, and what is the rate of progression up-stream?

Answer. They are first seen off the coast immediately previous to entering the mouth of the river. They are usually from one to three weeks passing from the mouth of the river to Clifton, about 20 miles. They first appear at the Dalles in the middle of April, about two months after their first appearance at the mouth of the Columbia. They appear in great quantities at the Dalles about the middle of June, or two months after they appear in large numbers at the bar. The falls of the Dalles are 200 miles up the river, which would indicate that their rate of pro-

gression to that point is about 100 miles a month. Dr. Suckley, in the Pacific Railroad Reports, estimates that the *Salmo scouleri* ascends the river at the rate of 100 miles a week. This variety, however, is a fall salmon and in great haste to deposit its spawn, which undoubtedly accounts for the difference of speed in the two instances. The spring (or summer) salmon are a week going from the Cascades to the Dalles. They are only a day or two getting through the Dalles, for they are seen above the Dalles a day or two after their first appearance at the mouth of the Dalles.

Question. If anadromous, what is the length of their stay in fresh water, and when do they return to the sea?

Answer. This question cannot be determined until it is known whether the fall runs of salmon are distinct from the *Salmo quinnat*. All of this latter variety return to the sea (or die) in August and September, as none are found in the river after that time having the characteristics of the spring run of the *Salmo quinnat*. It may be added here that vast shoals of the young of some salmon descend the Columbia in summer, passing the lower fisheries in June and July, and also that full-grown salmon of some variety are caught in considerable quantities, nearly exhausted, on the back of the drift-nets of the Lower Columbia in July and August.

Question. Do the different sexes or ages vary in this respect?

Answer. They do not.

Question. Do these fish come on to the breeding grounds before they are mature; or do you find the one or two year old fish with the oldest?

Answer. Fish of all sizes and ages above a year old are found together, on the breeding-grounds, except the salmon parrs recently hatched.

Question. What are the favorite localities of these fish? Say whether in still water or currents; shallow or deep water; on the sand; in grass; about rocks, &c.

Answer. These salmon are found anywhere in the river in deep water, in shallow water, over sand, gravel, and rocks; everywhere except in lagoons or sloughs, aside from the river, where the water stagnates.

Question. What depth of water is preferred by these fish?

Answer. No depth in particular.

Question. What the favorite temperature and general character of water?

Answer. The temperatures of the Lower Columbia are given below.

Table of daily temperatures of the water of the Columbia River at Clifton, Oreg., Sundays excepted.

Date.	7 a. m.	12 m.	Date.	7 a. m.	12 m.	Date.	7 a. m.	12 m.
1875.	°	°	1875.	°	°	1875.	°	°
May 10	51	51½	June 11	58½	60	July 14	66	67
11	50¾	51	12	58½	60	15	66	67
12	50	50½	14	59	60	16	66	67½
13	51	52	15	59½	60½	17	66	68
14	52	52	16	59½	61	19	67	68½
15	52	52½	17	59	61	20	67½	69
17	53	54	18	59	60	21	67½	69
18	54	54	19	59	60	22	68	68
19	53½	54	21	58½	59½	23	68	68
20	54	54½	22	58	59	24	68	69
21	54	54½	23	58	59	26	68	70
22	54	54½	24	58	58½	27	68	70
24	54	55	25	58	59	28	68	69
25	54	55½	26	58	59½	29	67	68
26	54	55¾	28	59	60	30	67	68
27	54½	55¾	29	60	60½	31	66	67½
28	54½	56	30	60	60½	Aug. 2	66	67
29	54½	56	July 1	60	61	3	65½	66
31	55	56	2	60½	61½	4	65	67
June 1	55	56	3	60½	60¾	5	65	66
2	55	56	5	62	63	6	66	67
3	55	56	6	63	64½	7	67	68
4	55½	56½	7	64	65	9	66	67
5	55½	56½	8	64	65	10	65	67½
7	56	57	9	65	66	11	66	67
8	56½	57½	10	65½	67	12	67	69
9	57	58	12	66	67	13	67	69½
10	58	59	13	66	67	14	68	70

The headwaters are, of course, much colder in the summer months. All parts of the river seem to suit the salmon, from which it may be inferred that all the temperatures of the table, together with the colder ones of the tributaries, are satisfactory to the *Salmo quinnat*.

6.—Relationships.

Question. Do these fish go in schools after they have done spawning, or throughout the year, or are they scattered and solitary?

Answer. They do not go in proper schools as mackerel and other sea fish do. I think each salmon makes its progress on its own individual account; but such vast numbers ascend the river at a time that they appear to move in schools.

Question. Have they any special friends or enemies?

Answer. Seals, sea-lions, otters, eagles, and ospreys are their special enemies. They have no friends that are of any good to them, that I am aware of. I should, however, except the Oregon legislature, which has at last provided a close-time for salmon, which example the Washington Territory assembly ought to follow as soon as possible.

Question. To what extent do they prey on other fish; and on what species?

Answer. The salmon devour great quantities of smelts and other smaller fish, when in salt water; but in fresh water they do not eat anything. Out of 98,000 salmon examined at the cannery of J. W. Cook & Co., at Clifton, Oreg., in 1875, only three had food in their stomachs,

and these were so fresh from the sea that their last meal in salt water had probably not had time to digest.

Question. To what extent do they suffer from the attacks of other fish, or other animals?

Answer. Large numbers are destroyed by seals and sea-lions. Many are also killed by otters, fisher-cats, and other animals, after ascending the river; but compared with the whole number of fish in the river, the proportion thus destroyed is small.

7.—Food.

Question. What is the nature of their food?

Answer. Smelts, small fish, and crustaceans, form their food in salt water. In fresh water they eat nothing.

Question. Are there any special peculiarities in the manner of feeding of these fish?

Answer. None that I know of.

Question. What amount of food do they consume?

Answer. They are voracious eaters, but the exact amount of food they consume is unknown.

8.—Reproduction.

Question. Is there any marked change in the shape or color of either sex during the breeding-season, or any peculiar development of or on any portion of the body, as the mouth, fins, scales, &c.?

Answer. A very marked change comes over each sex, both in shape and color, at the breeding-season, affecting especially the male sex. What this change is, it is not quite safe yet to describe, as it is not ascertained to a certainty which of the species found on the spawning-grounds of the Columbia is the *Salmo quinnat*.

Question. Are there any special or unusual habits during the spawning-season?

Answer. See last part of answer to previous question.

Question. Is spawning interfered with by lines or nets, or otherwise?

Answer. Not much.

Question. At what age does the male begin to breed; and at what age the female?

Answer. The male at two years, probably, and the female at three.

Question. For how many years can these fish spawn?

Answer. Not known.

Question. Does the act of spawning exert an injurious effect?

Answer. These salmon, without doubt, die in vast quantities after spawning at the headwaters of the river.

Question. Where do these fish spawn, and when?

Answer. In the tributaries of the river, and on the sand-beaches of the main river, even within 50 miles of the sea.

Question. Can you give any account of the process; whether the

males and females go in pairs, or one female and two males; whether the sexes are mixed indiscriminately, &c.?

Answer. The following description of the spawning of these fish is taken from p. 313 of volume XII, part II, of Pacific Railroad Reports:

"The fish remained stationary over the bed about half a minute, keeping herself from being forced down with the current by gentle motion of the fins, and during her stay apparently discharging a few ova, some of which were probably washed down the rapid, the rest falling into their proper receptacles. She then suddenly darted up-stream to a quiet resting-place. Immediately upon her departure several males took her place over the bed and remained there about the same length of time; they, in turn, retreated to a place of repose, the spawning-bed being quickly again occupied by one or more females, followed by males as before; the same bed thus serving for about half a dozen individuals of both sexes. The period of repose seemed to be about two or three minutes for each individual."

Question. Is the water ever whitened by the milt of the male?

Answer. Cannot say.

Question. What temperature of water is most favorable for hatching?

Answer. Probably from 55° in the main river, down to very cold water indeed in the headwaters.

Question. At what depth of water are the eggs laid, if on or near the bottom?

Answer. On the bottom, at a depth of 3 or 4 feet of water usually.

Question. What is the size and color of the spawn?

Answer. Color, reddish-yellow. Size, about a quarter of an inch in diameter.

Question. What is the estimated number for each fish; and how ascertained?

Answer. Cannot say.

Question. Answer the question for one season, and for the life-time.

Answer. Cannot.

Question. Do the eggs, when spawned, sink to the bottom, and become attached to stones, grass, &c., or do they float in the water until hatched?

Answer. The eggs sink to the bottom, and are covered by the parent salmon with stones and coarse gravel.

Question. Do the fish heap up or construct any kind of nest, whether of sand, gravel, grass, or otherwise; and if so, is the mouth, the snout, or the tail used for the purpose, or what; and if so, how is the material transported; or do they make any excavation in the sand or gravel?

Answer. They scoop out a kind of nest in the gravel and rocks, about 3 feet in diameter, using the snout, mouth, and tail in their work.

Question. Do they watch over their nest, if made, either singly or in pairs?

Answer. They do not; nor do they seem to show the slightest interest in their offspring after the eggs have been deposited and the nest covered up.

Question. When are the eggs hatched, and in what period of time after being laid?

Answer. Not known.

Question. What percentage of eggs laid is usually hatched?

Answer. No one knows.

Question. What percentage of young attains to maturity?

Answer. No one knows.

Question. What is the rate of growth?

Answer. This is not known, but it is supposed that the salmon attain a full average growth in three years.

Question. Do the parents, either or both, watch over the young after they are hatched?

Answer. Never.

Question. Do they carry them in the mouth, or otherwise?

Answer. No.

Question. What enemies interfere with, or destroy, the spawn or the young fish? Do the parent fish devour them?

Answer. Almost every kind of creature that lives in or frequents the water, including insects, fish, and fowl. The water-ouzel in particular, whose salmon-egg-eating propensities created such an animated controversy in Great Britain a few years ago, is very destructive to salmon-eggs and the newly-hatched alewives. The parent fish, however, do not eat their eggs.

Question. Are the young of this fish found in abundance, and in what localities?

Answer. They are found in great abundance in some localities at certain seasons, particularly at the headwaters of the rivers.

Question. On what do they appear to feed?

Answer. On all kinds of small animal food found in the water; perhaps more especially caddis-worms and small fish.

9.—Artificial culture.

Question. Have any steps been taken to increase the abundance of this fish by artificial breeding?

Answer. Nothing more than the selection of a favorable point for artificial propagation, if it should ever become desirable.

10.—Protection.

Question. Are these fish protected by law, or otherwise?

Answer. There is a close-time provided by the Oregon laws, protecting the salmon from Saturday night to Monday morning.

11.—Diseases.

Question. Have any epidemic or other diseases ever been noticed

among them, such as to cause their sickness or death in greater or less numbers?

Answer. No disease has ever been known to attack the salmon in the main river, but countless numbers of salmon die, at the spawning-season, in the tributaries which form the headwaters of the river.

Question. When have these epidemics taken place, and to what causes have they been assigned?

Answer. See answer to previous question.

12.—Parasites.

Question. Are crabs, worms, lampreys, or other living animals, found attached to the outside or on the gills of these fish?

Answer. The sea-louse is found under the fins of this salmon when it comes from the sea. Other parasites are found about the fins and on the gills at the spawning-season.

13.—Capture.

Question. How is this fish caught? If with a hook, what are the different kinds of bait used, and which are preferred?

Answer. This fish is usually caught with drift-nets in the main river. In the smaller tributaries, where the fish come up to spawn, they are killed with spears, clubs, and almost anything that can be used to deal a heavy blow with. At the Dalles of the Columbia they are caught in scoop-nets and weirs, and are killed by the Indians with spears, and, I believe, both here and in the tributaries they are drawn ashore with large hooks attached to long handles, which can be used with great effect where the salmon are very thick and the water is shallow. They are also caught in salt water with hook and line baited with live minnows. At the headwaters, where they are also taken with hook and line, the universal bait is salmon-roe, though it is possible to take them with the artificial fly.

Question. If in nets, in what kind?

Answer. The large nets of the main Columbia are drift-nets with meshes which allow the head to pass in as far as the gills, by which the salmon are caught. These nets are 1,200 feet long and 20 feet deep, and are drifted three or four miles. At Chinook a seine of 200 fathoms with a 4-inch mesh is hauled in June. They sweep out with the tide and catch salmon and trout by the bushel. There are three seining-grounds on the river. The seines are used in July. The meshes of the seines are 2 inches from knot to knot.

Question. At what season and for what period is it taken in nets, and when with the line?

Answer. The *Salmo quinnat* is taken in drift-nets from March or April till about the 10th of August. It is taken with hook and line whenever it is found in salt water or at the headwaters of the river.

Question. What would be the average daily catch of one person with the hook, and what the total for the season?

Answer. I have no data to enable me to answer this question with any degree of fullness.

Question. Answer the same question for one seine, or pound, of specified length.

Answer. Below may be found the actual catch at the fishery of J. W. and V. Cook (Oregon Packing Company), Clifton, Oreg., at various times in 1874 and 1875.

An average of twenty boats (*i. e.*, seines each 1,200 feet long) took in—

	Salmon.
April, 1874	7,570
May, 1874	23,486
June, 1874	32,784
A much smaller number of boats took in July, 1874	33,974

This averages for one boat (seine) in—

	Salmon.
April, 1874	378
May, 1874	1,174$\frac{3}{10}$
June, 1874	1,639$\frac{1}{10}$
July, 1874, probably upwards of	2,500

For the whole season of 1874, beginning about the middle of April and ending about the middle of August, at the fishery of the Oregon Packing Company, eleven boats brought in salmon as follows:

	Salmon.		Salmon.		Salmon.
No. 1	4,819	No. 5	3,939	No. 9	5,635
No. 2	5,740	No. 6	5,833	No. 10	5,169
No. 3	5,441	No. 7	5,440	No. 11	2,426
No. 4	4,391	No. 8	5,735		

At the same place in 1874 and 1875 the daily catch of one of the boats taken at random was as follows:

Date.	Salmon, 1874.	Salmon, 1875.	Date.	Salmon, 1874.	Salmon, 1875.
April 2	6	.....	April 16	26	34
April 3	10	.....	April 17	41	71
April 4	4	.....	April 18	36	Sunday.
April 5	Sunday.	.....	April 19	Sunday.	46
April 6	20	.....	April 20	44	35
April 7	16	.....	April 21	24	30
April 8	20	.....	May 1	19	51
April 9	23	.....	May 2	10	.....
April 10	19	.....	May 3	.....	.....
April 11	16	.....	May 4	33	53
April 12	Sunday.	43	May 5	27	40
April 13	16	50	May 6	29	66
April 14	19	51	May 7	42	.....
April 15	35	20			

Table showing number of salmon caught by one seine from July 15 to July 28, Sundays excluded.

	Salmon.		Salmon.		Salmon.
July 15	90	July 20	89	July 25	173
July 16	80	July 21	128	July 26	.....
July 17	90	July 22	115	July 27	158
July 18	73	July 23	108	July 28	147
July 19	.....	July 24	124		

Question. Is the time of catching with nets, or pounds, different from that with lines?

Answer. There are no salmon worth mentioning caught in the Columbia with the line.

Question. Is it caught more on one time of tide than on another?

Answer. Most of the salmon are caught about the turn of the tide.

14.—Economical value and application.

Question. What disposition is made of the fish caught, whether used on the spot or sent elsewhere, and if so, where?

Answer. Most of the fish caught in the Lower Columbia are preserved in cans at the great canneries. (See description of canneries, page 821.) Those caught above and at the Dalles are salted. A large number are also salted on the Lower Columbia. Great quantities are dried by the Indians of the upper rivers. Some, of course, though comparatively very few, are consumed fresh by the residents in the vicinity of the river. No fresh salmon are exported to any considerable distance. The salted fish, and especially the canned salmon, are sent all over the globe, and have a reputation unsurpassed by any others in the world. The heads, which are rejected at the canneries, are gathered by the oil-factories, where a large amount of very serviceable oil is obtained from them. Not many fish are smoked at the lower river, the wet climate being unfavorable to this method of curing.

Question. What is its excellence as food, fresh or salted?

Answer. The quality of the fresh *Salmo quinnat* of the Columbia River is superb, and is unequaled by any salmon of the same or a lower degree of latitude. The salted, and particularly the canned salmon, also possess a very high degree of excellence.

Question. How long does it retain its excellence as a fresh fish?

Answer. Only a day or two exposed to the air. In ice it can be kept a week and probably two weeks.

Question. To what extent is it eaten?

Answer. Vast quantities of the Columbia River salmon are eaten. The consumption of the canned salmon is enormous, as is seen by the fact that from 10,000,000 to 20,000,000 pounds are annually exported from the river. The salted fish are also in great demand as an article of food, and the only limit to the consumption of the fresh salmon is the limit of the population that can procure them, for every one would eat them if they could get them. Great quantities of fresh and dried salmon are eaten by the Indians.

Question. Is it salted down, and to what extent?

Answer. See answer to question What disposition? &c.

Question. Is it used, and to what extent, as manure, for oil, or for other purposes, and what?

Answer. This fish is not used, to any extent, for any purposes but for

food, with the exception of the heads at the oil-factories, from which oil is procured.

Question. What were the highest and lowest prices of the fish, per pound, during the past season, wholesale and retail, and what the average, and how do these compare with former prices?

Answer. For canned fish the market opened in April, 1875, at $4.80 a case—48 one-pound cans. This was a losing price, and the canneries declined to begin work. Soon after, about the 1st of May, prices rose to $5.90, which left quite a margin for profit, and in a very short time the canneries were under full headway. The price ranged throughout the season from $5.90 to $5.10, which is much lower than the figures of former years, canned salmon commanding, in 1874, $6 a case, and in previous years even more than that. The retail price of a pound-can of salmon is 25 cents everywhere, whether on the Columbia or in New York City. Salted salmon bring $8 a barrel of 200 pounds at San Francisco. Freights to San Francisco vary from $3 to $5 a ton, averaging $4. These figures, I believe, do not vary much from year to year. The prices for fresh salmon vary indefinitely, in proportion to their abundance. At times they are very abundant and very cheap. At other times they are very scarce and very dear. The canneries pay about 20 cents apiece for their fresh salmon. These will average in weight from 16 to 17 pounds when dressed, though occasionally one is caught weighing 50 or 60 pounds or more. The prices for fresh salmon in the season, at Portland, Oreg., range from 30 cents to $1.25 apiece. The first of the season bring $2 apiece. In November, 1875, canned salmon brought in San Francisco from $6 to $6.30 a case. Contracts for 1876 were being made the same month at $5.40 to $5.60. Salt salmon were very abundant in the San Francisco market at $7 a barrel.

Question. Are these fish exported; and, if so, to what extent?

Answer. The canned fish are sent all over the world in great quantities, nearly 20,000,000 pounds being exported in 1874. The salted fish are sold chiefly in the United States, South America, the Pacific islands, and Pacific coast generally. It is estimated that about 4,000,000 pounds of salted salmon were exported in 1874. No fresh or smoked salmon are exported.

Question. Where is the principal market of these fish?

Answer. San Francisco buys most of the canned and cured salmon of the Columbia, but chiefly to sell again. The fresh salmon find only a home market.

Question. Give name of and address of observer.

Answer. Livingston Stone, San Francisco, Cal.

Question. Give date of statement.

Answer. October 20, 1875.

C—OTHER VARIETIES OF SALMON.

The number of varieties of the *Salmonidæ* which one hears of on the Columbia River beside the *Salmo quinnat* is extremely confusing, so in speaking of others of the salmon family I will confine myself to the few varieties that I was able to identify. They are as follows:

1. *Salmo truncatus*, Suckley.
2. *Salmo proteus*, Pallas.
3. *Salmo Gairdneri*, Richardson.
4. *Fario stellatus*, Girard.
5. *Columbia River Smelts.*
6. *Salmo spectabilis*, Girard.

1.—*Salmo truncatus, Suckley.

Syn.—Common names: Straits of Fuca, Short-tailed Salmon; Puget Sound, Square-tailed Salmon; Cowlitz River, Salmon-trout; Willamette River, Winter Salmon.
Indian names: Klallam Indians, Klutchin; Nisqually Indians, Skwowl; Willamette River Indians, Hwanig.

The specific characters given by Dr. Suckley, on p. 327, of vol. xii, part ii, of Pacific Railroad Reports, are as follows:

"*Sp. Ch.*—Body fusiform; dorsal profile moderately arched; anterior margin of dorsal fin much anterior to a point equidistant between the nose and the insertion of the tail; head small, jaws fully provided with small teeth; tail small, its free margin, when extended, being almost straight, having a very faint tendency to lunation; scales generally large. Colors of the fresh-run fish, back of head, back, dorsal, and caudal fins, bright blue, spotted on the head with roundish, on the fins with oval spots of black; the blue of the back is silvery, that of the head and fins darker; the lower parts silvery-white, this color extending about an inch above the lateral line, and merging itself irregularly into the color of the back; no spots below the lateral line, which is faint and of a bluish-dusky color; lower fins pale and unspotted, their tips somewhat darkish."

This fish is identified without question. It is caught in large quantities in the Willamette River, just below the falls at Oregon, which are very difficult to pass. They arrive at Oregon City as soon as the water rises, about Christmas, at which time they are prime, and are both very fat and of very fine quality. The more water there is in the river in the winter the more the salmon come up. When the water becomes very cold they fall back. A rain brings them up again. They are most abundant in April, when they make great exertions to get over the falls to deposit their spawn. They are caught then in great numbers, both in scoop-nets and set-nets. The set-nets have a mesh of 7 inches. They are of different lengths, depending upon the opportunity the current affords

* See Nos. 452 and 454 of the writer's natural-history collection for the Smithsonian Institution.

for setting them, and are generally from 12 to 15 feet deep. The Indians use scoop-nets. They are about 2 feet in diameter, and are attached to a long wooden handle. The Indians also spear this fish.

The *Salmo truncatus* spawns in May, in the Willamette, and by June, they are all gone from this river; but in the Klackamas, which is a colder and purer stream, I was told they were found as late as August with ripe spawn in them. They average in weight about 12 pounds, though some have been taken weighing 25 pounds. In April and May, at Oregon City, when they are spawning they become thin, bruised, and very much deteriorated, as the *Salmo quinnat* also does at the time of spawning. The *Salmo truncatus* is distinguished in appearance from other salmon by its square tail, small head, round snout, comparatively slender form, light-colored meat, and by its spawning in April.

2.—Salmo proteus, Pallas.

Syn.—*Salmo gibber*, Suckley.
Common name: Humpbacked Salmon.
Indian names: Lummi Indians, Hunnun; Nisqually Indians, Huddoh.

The specific characters as given by Dr. Suckley, on p. 339, of vol. xii, part ii, of Pacific Railroad Reports, are as follows:

"*Sp. Ch.*—Male: Dorsal profile much more arched than in *S. scouleri*, Rich. After entering fresh water, an adipose hump becomes strikingly apparent, its greatest prominence being nearly opposite a point midway on a line drawn from the eye to the anterior margin of the base of the dorsal fin; intermaxillary projection curved downward, as in *S. scouleri;* jaws long, as in latter, the lower terminated by a dilated knob (as in several other species of the genus), which is armed with four or five strong, sharp teeth on each side; labials, and limbs of the lower jaw, closely set with very fine, sharp teeth, finer and more numerous than those of the *S. scouleri;* vomerine and palatine teeth much larger than those of the labials; those on the vomer disposed in a single row on its anterior portion; tail rather strongly lunated, and profusely dotted with elongated, oval, dark spots; the other fins usually unspotted, adipose, rather elongated; scales much smaller than those of the *S. scouleri;* those of the back are much smaller than those below the lateral line."

The identity of this fish is also unquestionably established, but it is neither abundant nor much valued in the Columbia River, although in Puget Sound it is said to be very plentiful every other year and much esteemed by the Indians. It is easily distinguished from all other salmon by the very conspicuous hump in its back.

Salmo gairdneri, Rich.

Syn.—Common name on Lower Columbia: Blueback.

The specific characters are given by Suckley and Cooper on p. 331, vol. xii, part ii, Pacific Railroad Reports, as follows:

Sp. Ch.—[Based on data given by Richardson and on the exam-

ination of two dried skins in the Smithsonian collection.] Profile of dorsal outline nearly straight. Tail terminating in a slightly semi-lunar outline. Ventrals correspond to commencement of dorsal and adipose to end of anal. Jaws fully armed with strong, hooked teeth, except a small space in center of upper jaw. Vomer armed with a double row for two-thirds of its anterior portion. Back of head and body bluish-gray, sides ash-gray, belly white, caudal spotted with oval dark spots. Snout rounded (much more blunt than *S. quinnat*). Head short and comparatively broad. Under fins light-colored.

This fish is undoubtedly the well-known blueback of the Lower Columbia, but it is also supposed by several fishermen to be the same as the square-tailed salmon (*Salmo truncatus*) of the Willamette. Suckley and Cooper (see p. 328, vol. ii, Pacific Railroad Reports) also say that it is possible that they may be found to be identical. As I was not successful in obtaining a specimen of the blueback during my short stay on the Columbia, I am unable even to express an opinion on this point.

This fish accompanies the *Salmo quinnat*, though in small numbers, in ascending the Columbia in the summer, but in the fall is much more abundant in the main river. It is easily distinguished from the *Salmo quinnat* by its having a smaller head, a less forked tail, a slenderer and straighter body, and in being a smaller fish. These, however, are the very characteristics which distinguish the *Salmo truncatus* from the *Salmo quinnat*. Suckley and Cooper, however, in comparing two imperfectly dried skins of the *gairdneri* with one of the *Salmo truncatus*, observed the following differences, viz: "The *S. truncatus* has the head smaller and shorter; tail neither so wide nor so long, and more spotted; teeth in the lower jaw more numerous, but smaller; muzzle and chin more pointed; body posterior to anal fin more slender. The lengths of the three skins were much the same, those of the *S. gairdneri* being slightly greater. The teeth of the latter are larger and more scattered, being in one specimen 9.9, and in the other 10.10, on the arms of the lower jaw. Those of the *S. truncatus* have 14–16 on each side, and although in line, were dispersed in a pair-like manner, *i. e.*, every other interval being greater. This pair-like disposition of the teeth is not seen in the *S. gairdneri*.

Fario stellatus, Girard.

Syn.—Common names: Common Trout; Oregon Brook trout.
Indian names: Nisqually Indians, Kwuss-putt; Wasco Indians, Opkalloo.

The specific characters, as given by Suckley and Cooper, on p. 346 of vol. xii, part ii, of Pacific Railroad Reports, are as follows:

"*Sp. Ch.*—Body elongated and fusiform; head well developed, contained four times and three-quarters in the total length; jaws equal; maxillary gently curved, reaching a vertical line drawn posteriorly to the orbit. Anterior margin of dorsal fin a little nearer to the extremity of the mouth than the insertion of caudal fin. Back light olive; belly light yellowish-white; head, body, and fins profusely spotted with black."

(See No. 459 of the writer's natural-history collection for the Smithsonian Institution.)

This is another well-defined species. It is the common brook-trout of Oregon. It is very abundant in the streams emptying into the Columbia below the Dalles. It resembles very much the common brook-trout of California, of which a very large number of specimens of all sizes have been sent to the Smithsonian Institution by the writer. (See Nos. 462, 476 *et passim* of the writer's Smithsonian collection.) Like the California mountain-trout, it also spawns in the winter, chiefly, I think, in January. In the small brooks of Oregon the largest do not weigh over 2 or 3 pounds, but in larger waters it is said to attain a weight of 15 pounds and a length of 2 feet. In California (if the same fish), they are taken in the McCloud River weighing 3 or 4 pounds. The *Fario stellatus* is found with both white and red meat. It takes the fly, and is particularly fond, as most trout are, of salmon-roe, which consequently makes a very effective bait. It is easily distinguished from the other *Salmonidæ* (supposing it to be the same as the common California brook-trout,) because it resembles none of them except the *Salmo masoni*, and from this it differs in having larger spots and more of them, in having smaller scales, and a red patch under the jaw.

Hypomesus pretiosus, (Girard) Gill.

Syn.—*Argentina pretiosa*, Girard. *Osmerus elongatus*, Ayres.

*Common name, Columbia River Smelt.

This fish is allied to the smelt, having the odd fin on the back between the dorsal and caudal, which distinguishes the salmon family. It is a very singular fact that, previous to the year 1870, there had been no smelts in the Columbia River for thirty years. Since then they have ascended the Columbia in vast quantities each year, usually during the last of March, but sometimes, as in 1871, in the month of February. It is also a very singular fact about these fish, that they never go up any river but the Cowlitz. The run lasts only about eight or ten days, although the fish remain in the river in all about a month. Their course can always be tracked by the flocks of gulls which follow them. Great quantities can be caught with nets, or fishermen's rakes, though very few in comparison with what might be, and a considerable number are so taken and sent to Portland fresh, but not many are salted, as it is their spawning-season when they ascend the river, and, to use a fisherman's expression, "they are all spawn at this season," and consequently not worth curing. This fish is easily distinguishable from all other varieties in the Columbia, because it resembles none of them at all.

Salmo spectabilis, Girard.

Syn.—Common name: Red-spotted Salmon.

Sp. Ch.—Body subfusiform in profile, very much compressed, the

*See No. 460, writer's Smithsonian collection.

head forming about the fourth of the total length. Maxillary bone curved, extending to a vertical line passing somewhat posteriorly to the entire orbit. Anterior margin of dorsal fin a little nearer the extremity of the snout than the base of the caudal. Brownish-gray above; silvery beneath. Dorsal region and upper portion of the flanks spread over with light spots, those on the sides bright red as in *S. fontinalis*.

There is so much confusion and even contradiction in the descriptions given of the *Salmo spectabilis* that I am almost certain that there are two species of red-spotted trout on the Pacific coast entirely distinct from each other, and very different in their habits. One is the fish which is found in Dog River, Oregon, near Mount Hood, and also in the McCloud, near Mount Shasta, California. The other is the red-spotted trout that is so abundant in the bays and rivers of Puget Sound in the autumn. The first inhabits only the coldest waters, is not very abundant anywhere, and is not anadromous. The second is not so particular about the temperature of its habitat; is exceedingly abundant in the Nisqually, Dwamish, and other rivers of the northwest coast, and is unquestionably anadromous. Which fish Dr. Girard meant to designate by the *Salmo spectabilis* it is impossible to tell, but he undoubtedly meant one or the other, and if he intended to indicate the anadromous fish, then the mountain-fish has not been named, and if he meant to indicate the mountain-trout, then the anadromous fish has not been named.

As I have seen only the mountain red-spotted trout, I will confine myself entirely to this variety. This trout, as just remarked, is found only in the very coldest waters, usually at the head of some stream which is directly formed from melting mountain-snows. This accounts for its being found in Dog Creek, which heads in the snows of Mount Hood, and in the upper waters of the McCloud River, California, which heads in Mount Shasta, another mountain which is covered with perpetual snow. It is so attached to very cold water that it will rarely descend to the mouth of the McCloud River while the temperature of the water there is over 52° Fahrenheit. It spawns in May or June. It is a very voracious fish, and will take a fly or live bait with avidity. It may be distinguished from all other fresh-water trout by its bright red spots in connection with its peculiar form, which is more rounded than any other variety of American trout.

I saw and heard of many other varieties of *Salmonidæ* while on the Columbia, but I am not sufficiently sure of any of them to identify them with any certainty.

To illustrate the contradictory character of the information one meets with in inquiring into the salmon of the Columbia, I will repeat briefly what I was told about them at various points by experienced fishermen. At Astoria I was told that there were only two kinds of salmon in the river, the spring salmon and the fall salmon. At Clifton I was told by Mr. J. W. Cook that there were the Chinook Salmon, the Bluebacks,

the Silverside Salmon, the Hard-heads, the Humpback Salmon, the Hooknosed Salmon, the Brook Trout, the larger Brook Trout, the Salmon Trout, the Lake Trout.

I discovered afterward that Mr. Cook was right as far as he went; but as I had just arrived on the river and had not identified any of the fishes at that time except the *Salmo quinnat*, the contradictory character of my information seemed very discouraging.

The varieties mentioned by Mr. Cook I afterward found to be as follows:

The Chinook Salmon is the *Salmo quinnat.*
The Blueback is the *Salmo gairdneri.*
The Silverside Salmon is the *Salmo* sp.?
The Hard-head is the *Salmo truncatus.*
The Humpbacked Salmon is the *Salmo proteus.*
The Hooknosed Salmon is the *Salmo scouleri.*
The Brook Trout is the *Fario stellatus.*
The large Brook Trout is the *Salmo masoni.*
The Salmon Trout is the *Salmo gibbsii.*
The Lake Trout is the *Salmo* sp.?

On the Willamette I was told by the fishermen that there were, besides the varieties just mentioned, the Dog Salmon, the Klackamas Chinook Salmon, the Klackamas Trout, the Fall Chinook Salmon, the Fall Silver Salmon, and, in fact, a different salmon or trout in almost every different river. I could not identify any of these except the first, which is certainly the *Salmo canis* of Suckley, but it is very doubtful whether the *Salmo canis* and also the *Salmo Scouleri* are not merely the altered forms of some of the varieties of fish already mentioned after undergoing the very great changes which come on as the eggs and milt become ripe for the spawning-season. Indeed I feel very sure that the *Salmo canis* is a form of one of the other varieties which it takes at the approach of the spawning-period.

D—METHODS OF FISHING.

The various methods of fishing for the *Salmonidæ* on the Columbia may be found mentioned in the answers given above to Professor Baird's questions on the *Salmo quinnat*, but I will also offer here a recapitulation of the different methods of capturing the fish. They are—

1. By drifting with drift-nets, as at all the canneries of the Columbia.
2. By hauling a seine, as at Chinook and various points on the Columbia.
3. By set (gill) nets, as at Oregon City, on the Willamette.
4. By scoop-nets, as at the Dalles and the Falls of the Willamette.
5. By dip-nets, as at the Dalles.
6. By hook and line, as at the mouth and also at the headwaters of the Columbia, for salmon, and in all the smaller streams for trout.

7. By traps and weirs, as at Oak Point and various places on the Columbia.

8. By fishing-rakes, as at the Lower Columbia, and the Cowlitz for smelts.

9. By "twitching-hooks," as at the Falls of the Willamette for salmon.

10. By spearing, as everywhere, among the Indians, where the water is shallow enough.

E—THE CANNERIES OF THE COLUMBIA.

Every one has heard of the canneries of the Columbia. They have well deserved the reputation they have acquired, for seldom has a branch of industry assumed so quickly such large proportions or yielded such large profits to those engaged in it. It is only a very few years since the first salmon-cannery on the Columbia, commenced operations, and last year (1874) there were fourteen large establishments, employing in the aggregate nearly two thousand men and turning out nearly twenty million pounds of salmon in cans.

In May, 1875, I visited the cannery of the Oregon packing company carried on by J. W. and V. Cook through whose kindness I was enabled to obtain much information about the process of canning salmon, as well as about the fisheries and natural history of the salmon of the Columbia. The Messrs. Cook employ about one hundred and fifty men, mostly Chinamen. They run an average of twenty boats through the fishing season, (from the middle of April to the middle of August) and their buildings which are conveniently located and very methodically constructed cover nearly half an acre of ground. The buildings extend to the waters edge or rather they are built out over the water so that small boats can go under them. In front of the cannery is a platform very firmly built on piles which forms a wharf to which the ocean steamers can run up. At one corner of the establishment, and just in the rear of the wharf is a large rack opening on the river which receives the salmon fresh from the water just as the boats bring them in from the seines. This rack is capable of holding one or two thousand salmon. From the rack the salmon are passed to the cleaning bench, where the heads, tails, fins, and entrails are removed, and the body of the fish thoroughly washed in three different waters and with a hose. From the cleaning bench the salmon is passed on to the cutter where a system of revolving knives cuts the fish transversely into pieces about 4 inches long. These pieces are then passed on to the canning bench, where chinamen who are required to wash their hands every half hour, cut up the fish with meat knives into pieces of a suitable size for canning, and pack them into cans. The filled cans are then pushed on to the next bench where the covers are fitted on. The next set of Chinamen solder on the covers and pass them on to another set, who place them on iron racks and lower them into the boilers. After being sufficiently boiled the cans are taken out, washed, cooled, tested, labelled, cased, and placed on the wharf ready for shipment. In the course of the entire

process the salmon pass through forty or fifty hands. In 1874, the Cook Bro's. cut up 98,000 salmon, averaging in weight between 16 and 17 pounds when dressed. They shipped upwards of 30,000 cases containing 48 one-pound cans each.

There were in all in the spring of 1875, fourteen canneries on the Columbia the first being at Astoria, only a few miles above the bar at the mouth of the Columbia, and the last or uppermost being 60 miles up the river at Rainier.

I give below a list of the Columbia River canneries in May, 1875, in the order in which they come as one descends the river from Portland, Oregon.

Name.	Number of cases shipped in 1874. (In round numbers.)
1. R. D. Hume, Rainier. (Sixty miles from the mouth of the river. Not running now	6,000
2. William Hume	23,000
3. George W. Hume	35,000
4. Joseph Hume	30,000
5. A. S. Hapgood	25,000
6. John West & Co	35.000
7. T. M. Warren	25,000
8. Watson Bro's & Braman	16,000
9. Oregon Packing Company, (J. W. & V. Cook)	30,000
10. R. D. Hume, Bayview	37,000
11. Columbia River Salmon Company	10,000
12. Meigler & Co	16,000
13. Badalet & Co., Astoria	15,000
14. Booth & Co., Astoria. (Had not begun operations)	
Total	303,000

As each case contains 48 one-pound cans* this makes a total of 14,256,000 pounds of canned salmon that were put up at the canneries of the Columbia River in 1874.

The cannery of Booth & Co., at Astoria, which made no returns last year for the simple reason that it was not built, was ready to commence work at the beginning of the season of 1875. This establishment now employs about 175 men and does a large share of its work by steam. It is the largest on the river and in May, 1875, the proprietors expected to turn out 45,000 cases of salmon, the coming season.

Some notion of the magnitude of these establishments may be arrived at by considering that at some of the larger ones the tin alone for the cans costs between $50,000 and $100,000. The salmon themselves that are consumed in all the canneries of the river in a year, if placed lengthwise in a line, would reach upwards of 500 miles; while the cans if laid on their sides and placed end to end would reach from New York to Omaha.

The prices of canned salmon have varied very much during the last few years. In 1874 the average price was $6 a case, or 12½ cents per

*Usually, though, some two-pound cans are put up.

pound can. At the beginning of the season in April, 1875, prices had dropped to $4.80 a case, or 10 cents a can, which did not pay expenses, the cost being on an average, $5 a case. In consequence the canneries in 1875 did not open at all at first, but a little later prices went up again to $5.90, which gave a margin of profit, and the canneries began operations.

Prices have averaged between $5.20 and $5.40 a case this year, which has enabled the canning establishments to make a moderate profit; but the business is not as it has been in past years, when the larger canneries cleared from $30,000 to $70,000 in a season.

Besides the fish that were canned on the Columbia last year, (1874,) there were about 250,000 salted and barreled. The salted salmon bring from $7 to $8 per barrel of 200 pounds in San Francisco. A considerable number of salmon are, of course, consumed fresh, but owing to the very limited market for them at home, and the impracticability of exporting them fresh, the quantity so used is in comparison exceedingly small. (See answers to questions relative to food fishes of the United States pages 4–44.)

In concluding these notes on the Columbia River, I will say that in pursuance of my instructions to look up a suitable point for hatching the Columbia River salmon artificially, I made careful inquiries and at last found a place which appears to be in every way suited to the purpose. It is at Klackamas Falls, about 25 miles up the Klackamas River, where both the *Salmo quinnat* and the *Salmo truncatus* can be captured at their respective spawning seasons in vast quantities. Should the United States Fish Commission ever decide to carry on salmon hatching operations on the Columbia, I think it can be done here with distinguished success.

IV.—NOTES ON SOME FISHES OF THE DELAWARE RIVER.

By Dr. C. C. Abbott.

A—THE LARGER ACANTHOPTEROUS FISHES OF THE DELAWARE RIVER.

1.—INTRODUCTORY.

Trenton, N. J., *January* 27, 1875.

Dear Sir: In accordance with your request, made last June, I have gathered into shape the various notes that I have made in the field during the last fourteen years, on the habits of our fresh-water acanthopterous fishes, omitting all reference to the Etheostomoids. Since 1860, I have availed myself of every opportunity to learn something, however trifling, of the habits of even our commonest fishes. The results of my study in this direction, relating to the Cyprinoids, have already been published; and as I had, of late years, given them more attention than any of the other families of fishes represented in our waters, I was not aware, until I came to prepare my "notes" for you, how little I really knew concerning the Percoids; so I fear you will find nothing of value in what I send you now.

I would take this opportunity, however, to make a few general remarks, first, on the Delaware River as a valuable "food-fish" stream; and secondly, on the general character of the habits or life-histories of our common fishes.

There is reason to believe that there has been no material change in the principal physical features of the Delaware River; and to show what the river formerly was, as a food-fish stream, I will quote from a letter written by Mahlon Stacy, at "Falls of the Delaware," Fourth month, 26th, 1680. He says:

"Fish in their season are very plenteous. My cousin Revell and I, with some of my men, went last Third month (March) into the river to catch herrings; for at that time they came in great shoals into the shallows. We had neither rod nor net, but, after the Indian fashion, made a round pinfold, about two yards over, and a foot high, but left a gap for the fish to go in at; and made a bush to lay in the gap to keep the fish in; and when that was done, we took two long birches and tied their tops together, and went about a stone's throw above our said pinfold; then hauling these birch boughs down the stream, where we drove

thousands before us, but we got as many into our trap as it would hold, and then we began to haul them on shore, as fast as three or four of us could, by two and three at a time; and after this manner, in half an hour, we could have filled a three-bushel sack of as good and large herrings as ever I saw. And though I speak of herrings only, lest any should think we have little other sorts, we have great plenty of most sorts of fish that ever I saw in England, besides several others that are not known there, as rocks, cat-fish, shads, sheep's-heads, sturgeon."

There are two features of this extract from Stacy's letter to which I would call your particular attention. One is, the exceeding abundance and tameness of the herring, even in the shallowest waters; and the "great plenty" of the other desirable fishes to which he refers. If I am correct in considering the Delaware, both as to its bed and the purity of its waters, as essentially unchanged since Mahlon Stacy's time, then there is reason to believe that possibly by learning the several causes that have led to the diminution of the food-fishes, something practical may be done to repair the loss. It will be noticed that first in the list of those other desirable fishes that the river contained besides herring, Stacy mentions the "rock." As I have mentioned in my detailed notice of this fish that I consider it to be the worst enemy of the shad (and equally of the herring), may it not be that, subsequent to Stacy's time, a marked increase in the numbers of rock-fish may have been, and is, a powerful cause of the diminution of the shad and herring, rather than any amount of net fishing or other persecution by man of the breeding-fish? You know how true it is that pike will soon destroy all the trout of a mountain-brook. It must be remembered, too, that when the fish in the Delaware were so very abundant, the aborigines were thickly settled along its banks, and by nets, pounds, and baskets, caught innumerable thousands of these very shad and herring. Such numbers of rock-fish need not wander the whole length of the river and its tributaries to destroy the shad and herring, but, congregating in the bays and tide-water, destroy the young fish when on their way to salt water, in early autumn. If there be any truth whatever in this suggestion, will not one way to re-establish the desirable food-fishes be, to protect them by destroying, if possible, their enemies, in the way of less valuable fishes? I fear that there is, in the presence of rock-fish, an obstacle to stocking the Delaware with salmon, that will prove to be serious; for, although of late years very large rock-fish have become less abundant, there is no lack of smaller ones, say from eight inches to a foot in length. The second point of interest in Stacy's letter is, his reference to the "cat-fish, sheep's-heads, and sturgeon." The former are too well known to need any note concerning them, but I would incidentally mention that I believe that they have very materially declined in size within two centuries. They are apparently dying out, losing ground, giving way to other species; which, I know not. My reasons for this opinion I will give in another paragraph. The fish called by him the "sheep's-head," is of

course not the sea-fish so named by most people, but the common river-chub (*Semotilus rhotheus*). I am inclined to think that this species, too, is on the decline. Sturgeon are yearly decreasing in numbers, and I doubt not, if nothing is done to prevent it, will soon become as scarce as the "gar" (*Lepidosteus osseus*), which was formerly very abundant.

In conclusion, allow me to make a few remarks with reference to the ordinary habits of fishes, and to some supposed changes that have taken place in the course of two or more centuries.

Probably to a much greater extent than has been supposed, all fishes are nocturnal in their habits; and even those that move freely about during the day are even more active at night. Either by an arrangement of the eye, as in the nocturnal owls, or by some other sense, they have the ability to move with the same rapidity when it is, to men, "pitch dark," as in the brightest sunshine. By a series of experiments, made with traps of different kinds, I found that even our small sun-fish, on the darkest nights, moved freely about and readily took the hook, if properly baited. Cat-fish are all genuine "owls," and from fykes kept constantly in position, 93 per cent. more fish were taken between sunset and sunrise than between early morning and evening. This does not apply simply to twilight and dawn; but on dark nights, when I could distinguish nothing a dozen feet off, not only perch, but cat-fish, and the Cyprinoids generally were darting through the water.

This night study of fishes brings two species prominently into notice, the economical value of one of which is really considerable. I refer to the common eel (*Anguilla acutirostris*) and the lamprey (*Petromyzon americanus*, Lesueur). Both of these fishes are exceedingly abundant in the Delaware and its tributaries, and of much interest, the one as an excellent article of food, the other as a great destroyer of the ova of other fishes.

The eel, abundant in every stream of water, mill-pond, and meadow-ditch, as well as the river itself, is worthy of far more attention as a food food than it has received; for it appears, judging from the annual reports, to have been largely overlooked by the State Commissioners of Fisheries. From long observation, I am disposed to acquit them of the charge of destroying large quantities of ova of other fishes. So far as I can determine, their food is of a varied character, and while a mass of eggs would not be passed by unheeded, they do not appear to hunt them up, or follow breeding fishes to their spawning beds. This latter habit, however, I am fully satisfied, is a characteristic habit of the lamprey. This fish, which is found occasionally hibernating in the soft mud at the mouths of some of the in-flowing creeks, appears to come from the bay or ocean, (at any rate from the lower portion of the river,) in immense numbers early in March, and remains about the rocks at the head of tide-water for some time, as though waiting for the coming shad and herring. With the shad they pass up the river beyond tide-water, and in the rapid, rocky portions of the river, having deposited their own

ova, they wander over the breeding grounds of other fishes, and devour every egg they can find. I have found lampreys in Crosswick's Creek in the month of May, gathering up the eggs from sun-fish's nests; and several times, when at the shad fisheries, I have taken small lampreys —from 5 to 7 inches in length—that were attached to shad, with their sucking discs (mouth) firmly closed on the vaginal orifice, through which they were sucking the eggs.

Investigations of an archæological character have led me to unearth a vast number of Indian relics, as you know. In the prosecution of this work, I have found two quite extensive fresh-water shell-heaps or kjökkenmöddings. Bones of water-birds and our common fishes were, in each case, noticeably abundant; and from the marked abundance of very large bones of many of our fishes, as the sturgeon, gar, rock-fish, and cat-fish, I am satisfied that, excepting the sturgeon, individuals of a larger size than ever occur now were quite abundant. This is the "supposed change" to which I refer in a previous paragraph.

In the accompanying pages, I have given you, in some detail, my observations on the habits of certain fishes.

Trusting you will pardon many defects of omission and commission, I remain, very truly, yours,

CHAS. C. ABBOTT.

Prof. S. F. Baird,
United States Commissioner.

2.—The Yellow Perch, *Perca flavescens*, (Mitch.)

This very abundant species is known throughout the State only as the "yellow perch."

So far as I have been able to follow it this fish remains in the stream in which it was hatched throughout that year, and indeed for many years; the exception being that small perch will seek larger streams as they reach adult size if it happens that a gravid perch has entered a smaller from a larger stream to deposit its spawn. This quite frequently occurs. Thus many perch leave the Delaware River, and seeking out suitable localities in the smaller creeks that have an uninterrupted outlet, they deposit in these smaller streams their ova.

The yellow perch in the Delaware and such of its tributaries as I have examined is strictly resident, and can scarcely be said to be more abundant at one season than another, although in winter and the early weeks of spring they are more difficult to catch.

In the Delaware River I believe the yellow perch to be less abundant—except during the winter—than the rock fish (*Roccus lineatus*) or the white perch (*Morone americana*); but in the tributaries of the river, as Crosswick's Creek, (Burlington County,) and in many mill-streams not having uninterrupted outlets, they are more abundant than the two species above mentioned. It is, in fact, somewhat difficult to determine

the comparative abundance of this perch, inasmuch as I have frequently found two streams apparently alike, and not widely apart, maybe in the one case filled with them, and in the other wholly wanting them; but if we compare their numbers with the non-anadromous percoids it will be found not as abundant as the common sun-fish (*Ichthelidæ*) with which they are frequently associated. I have no means of determining the maximum size of the yellow perch. A specimen caught in the Delaware River at Bordentown, Burlington County, New Jersey, in May, 1865, weighed 4 pounds 3½ ounces. I have frequently met them weighing 1½ to 2 pounds. An average sized adult yellow perch, as found in the Delaware River and the principal inflowing creeks, may be said to be 9 inches in length and weigh from 6 to 8 ounces.

The young perch, by November 15 of their first year, *i. e.*, when six months old, are about 2¼ inches long. Of their subsequent growth I have not been able to determine anything positively, but believe it to be rapid. It very probably varies with the abundance or comparative absence of live food; as in some ponds where cyprinoids are not abundant the perch seem never to attain to large size.

No distinctions of sex are noticeable in the smaller fish, *i. e.*, of one and two weeks' growth, either in the shape, dimensions, or rate of growth; but when the full growth has been attained, or at least, the generative functions become active, the females, early in the spring, are easily known by their more prominent abdomens, and a duller tinting of the yellow surfaces of the scales. The transverse bands are duller, and the abdominal fins also have less of the brilliant carmine-color characteristic of males, especially at this time of the year.

On the approach of very cold weather—and it seems as if these as well as all other fishes could foretell the state of the weather—the yellow perch leave the shallower waters and congregate in deep holes, where the water at the bottom appears to remain sufficiently warm for them. Thus in December and January I have found a large number of them in a deep hole—in the bed of a tide-water creek, of about one-half of an acre in extent, and of an average depth of 20 feet. Such fish remain throughout the winter in moderately good condition, are active and in high color, although upon examination their stomachs prove to be empty, or very nearly so. When found at this season (winter) and in such a spot they will not take the hook, however baited.*

In March, although there may be considerable ice still in the water, floating or stationary, they will take the hook very eagerly, and from that time until late in autumn are certainly a very "gamy" fish to capture. In May, when the female perch are heavy with ripe ova, they will not take the hook very readily, although not as a rule refusing it; but this critical season does not seem in any way to influence the habits of the males. At this time the violent exertions of the fish, when taken

*A friend assures us he has taken them in midwinter from such holes when with live bait he was fishing for pickerel.

with a hook, causes a small extrusion of ova; but I have not noticed the males to drop their milt.

The yellow perch appears to be equally at home in quite different localities. As a still-water pond fish, if there is a fair supply of spring-water, they thrive excellently; but the largest specimens we have met with were either from the river or from the mouths of the larger in-flowing creeks. I believe that for the adult fish, deep water, of the tempe. rature of ordinary spring-water, having some current, and the bed of the stream, at least, partially covered with vegetation, is about such a locality as best suits this fish; this belief being based upon my experience in seeking out localities that afforded good sport in taking them with a line. Occasionally we have taken them of very large size in quite shallow waters. In such cases, it was evident that they were then following small cyprinoids, to feed upon them. When not in pursuit of food, they seek the deepest waters of the stream, preferring it to be of a depth of 10 feet, at least. Here they remain, quiet and close to, if not resting upon, the bed of the pond or stream. In streams of very clear water, we have occasionally seen numbers of perch resting apparently upon the bed of the stream, side by side, and all with their heads up-stream, just as, in August, we have seen a closely packed, crimson mass of "red-fins" (*Hypsilepis cornutus*) in a deep basin of some rapid mountain-brook.

The yellow perch is what may be called semi-social. Without going in schools, as do the herring; they are usually found in considerable numbers; associated, as it appears to me, more because the character of the locality is attractive to them, than from any pleasure in associating with their own kind. This is one of those impressions that a close observer will get, without being able to point out any one or more peculiarities in their habits which seem to prove it true. At all times they freely associate with other percoids, in the same manner as with individuals of their own kind, and follow, when hungry, associated with rock-fish (*Roccus lineatus*) and white perch (*Morone americana*), the scattered schools of cyprinoids, on which all three of these fishes so largely prey. The food of the perch, in fact, seems to be exclusively minnows. I have never detected any other food, except earth-worms, or an occasional grasshopper or cricket; these latter, however, may be considered as accidental articles of food. Probably, too, every spring, they feed to some extent upon their own ova and those of other fishes; but we have found that the water-turtles, especially the plain and spotted turtles (*Calemys muhlenbergii* and *Nanemys guttata*), are the worst enemies that fish have—*i. e.*—at any rate suckers breed in small streams.

In feeding, yellow perch chase small minnows, instead of waiting for a single fish to come near enough to seize by a single dart upon it, as the pike does. In catching the minnows, they are not rapid in their movements, but seem to dart with open mouth at several minnows, as though trusting to catch some one of the number they pursue. While

the amount of food consumed is considerable, they are not, I judge, as voracious as pike of the same size.

There is a decided deepening of the whole coloration of the male fish in the month of May, when the depositing of ova takes place; and with the higher coloring, is that increased activity, or restlessness, noticeable in so many of our fishes at this season of the year. I have not been able to determine, but judge, from the measurements of the smallest female with ova that I have examined, that the third summer (two-year-old fish) is the commencement of their spawning; but for how many years subsequently this is continued, I have no means of judging; but it is certain that they continue to grow long after the maturing of their generative organs. Some of the very largest yellow perch I have ever seen were taken in nets in the Delaware, and were females with apparently ripe ova.

In New Jersey, early in May, the sexes go in pairs to cool waters, having some current and a sandy or pebbly bed, with a moderate amount of vegetation (*Myriafilum obtusum* preferred), and the ova are deposited on the bed of the stream, quite near the shore. The milt is deposited immediately after, the two fishes being side by side while the process is going on. The temperature of the water is about 55° Fahrenheit.

The eggs, when extruded, sink to the bottom of the "nest" in small masses, and there remain, adhering to the pebbles or sand, until hatched, and the ordinary flow of the water does not seem to disturb them; although they have no protection from the current other than being in a very shallow basin, made by the female fish pushing to either side, with her abdominal fins, the coarser pebbles, or a little of the sand, immediately before she commences spawning.

The female fish, having deposited her eggs, immediately quits the nest, followed by the male, and the eggs they have deposited and fertilized are not disturbed by them, and certainly are not subsequently visited. So far as I have been able to judge, the parent fishes pay no further attention to the eggs, and lose all trace of their progeny's whereabouts. The eggs, numbering about 8,000, are hatched at the end of four or five days, at most; or at least a good proportion are; for at the end of a week or ten days I have frequently found minute yellow perch, associated with little sun-fish, tangled in among the water plants, active as their strength permitted, and darting voraciously at almost invisible specks, that seemed to serve them for food. In the immediate neighborhood of the "nest" I have seen many hundreds of such little perch, and once gathered about 500 (estimated) with one sweep of a scoop-net, when hunting for "pirates" (*Aphrodederus sayanus*). Whether this perch is a desirable species with which to stock ponds, or not. I will offer no opinion; but experiments I have knowledge of, certainly indicate that it is very easily reared artificially.

As a food-fish, there appears to be a great deal of difference of opinion as to its value; but in the markets at Trenton, N. J., it is not

looked upon as desirable, if pike, rock-fish, or white perch are to be had. The flesh, however, cooked is dry and chippy; and the difficulty in removing the scales is an objection we have often heard urged against it by those interested parties, the cooks. In market it seldom brings over ten cents per pound.

3.—Rock-fish, *Roccus lineatus.*

This well-known fish is known throughout New Jersey by the two names of "rock-fish" and "striped bass." The former name is used by the fisherman of the Delaware almost exclusively; along the sea-coast, the latter name is that principally used.

In the neighborhood of Trenton, N. J., the rock-fish is found not only in the river, but in such inflowing creeks as have water sufficient for it to swim. When small, it delights in wandering into small streams to catch the myriads of small minnows that congregate in the eddies of every brooklet. Prior to the erection of the dam at the mouth of the Assunpink Creek, at Trenton, they undoubtedly ascended this considerable creek, as in a fresh-water Indian shell-heap (kjökkenmöddings,) eight miles from the outlet of the creek, I found many bones belonging to this species. They still, in large numbers, pass up Crosswick's Creek, at Bordentown, N. J., as far as the dam at Groveville; and in this creek, some occasionally, if not regularly, breed. I am inclined to think that the rock-fish wander up every stream that has a decided current, they caring more for this than depth of water. Into really still waters, they do not go, and if confined in such ponds, unless copiously fed with spring-water, they will soon die.

While the rock-fish cannot certainly be considered as a resident in the Delaware, *i. e.*, remaining throughout every month of the year, on the other hand, their movements seem to have no regularity about them, as in the case of shad or herring. We have seen them caught with a net as early as February, but they are most abundant (small fry and up to 10 inches in length) from July 1 to October 1. They are not very abundant; not nearly as much so as the white perch (*Morone americana*), with which, when small, they are always associated. As compared with the white perch, they are about as 1 to 20, this estimate being based on the proportion taken, when fishing with a line for the latter, in the months of August and September; and nothing noticed at other times indicated that the proportion varied from that stated.

From the Upper Delaware—non-tidal portion—and, in a less degree, from the tide-water, the large rock-fish have greatly decreased during the past twenty years; but what the cause may be, unless excessive net-fishing, I cannot say. There can be no diminution of the amount of food, certainly, for the river now is as full of cyprinoids as it well can be, and from Philadelphia, northward, there is no perceptible defiling of the waters by the manufactories upon the banks. There has, curiously enough, been no noticeable diminution of the smaller ones, and judging

by their numbers—specimens varying from 1 inch to 10—the rock-fish must breed in the river or its principal tributaries, very generally.

The largest rock-fish that I have accurate knowledge of, taken in the Delaware River, at Trenton, weighed 40 pounds; but I have no measurements of the specimen. Fish from 2 to 5 pounds are not uncommon; but specimens of greater weight, formerly abundant, are now only occasionally met with, at least above Philadelphia.

While it is well known that the rock-fish comes up the river from the sea, and enters, as stated, the various tributary streams, there is something of a mystery connected with their movements in this respect. I think there can be no doubt but that the usual time of spawning is in June, and that many come from the bay (and ocean?) in April and May for that purpose; but in August and September, when the thousands of young shad are going seaward, there is such an increase in the numbers of large fish that I am inclined to think many non-breeding fish come up from salt water at this time to prey upon the young shad, or that the rock-fish breed in tide-water and much to the south of Trenton, N. J.

The favorite localities of these fish may be broadly stated to be in swift currents of varying depth—the larger fish in the deeper waters. I have never discovered that they exhibited any predilection for the neighborhood of rocks, patches of grass, &c. A decided current and cool water are the two essentials, and without them they soon perish.

The food of the rock-fish consists exclusively of small fishes; and it is the pursuit of them into small streams that explains their presence where one would hardly expect to find them. A rock-fish will frequently "corner up" a small school of minnows, and then pick them up as rapidly and with as great ease as a fowl will pick grains of corn; and while devouring the luckless minnows, will keep them in a small space, close together, all the time. There is no cessation of this murderous work while a fish remains; for after devouring all that it is possible for him to hold, a mere love of destruction keeps him at work. I once had a very favorable opportunity of watching the rock-fish feed in this way. It was a moderate-sized fish, about a foot long, and as near as I could determine it devoured a dozen "cyprinellas" (silver-finned minnows) in four minutes. If I err in my estimate it is on the safe side, and it may be it was fifteen minnows in that length of time. I subsequently captured a dozen of these pretty shiners, and found I could by no means squeeze them into a bulk that was not much larger than the estimated interior of a rock-fish a foot in length; and yet it is certain that the minnows captured by the rock-fish were swallowed without decapitation or other reduction of size, for in that case I should have seen the fragments of the minnows floating in the clear waters.

I have already expressed the opinion that the rock-fish spawns, in Central New Jersey, about the 1st of June. This occurs in the tributaries of the river, if not in the river itself. As yet I have not been able to find them in the act of spawning, or even the impregnated ova,

(believe the egg *not* to be agglutinated). My observations have been wholly confined to Crosswick's Creek, seven miles south of Trenton, N. J. This stream is a tidal one, with an uninterrupted flow of about eight miles, to the dam at Groveville. The rock-fish are taken in it, by both nets and line-fishing, in considerable numbers. At the wharf at Abbottville I have taken a dozen with a line in the course of a morning's fishing. As is usual in such cases, they were associated with the white perch, (*Morone americana*). My belief is, that the (comparatively speaking) few adult fish that pass up the creek in March and April, accompanying the shad, breed in the upper cool waters of the stream; for on reference to my field-notes, I find records made of young rock-fish taken in specimen nets as small as one and a quarter ($1\frac{1}{4}$) inches in length; the capture bearing date of June 8, 12, 9, 11, and 13, of five successive summers. These very young fish in every case were quite abundant, and associated in large loose schools, as though a single "batch" had remained together, just as young cat-fish do, but without the parent fish. They are easily recognized by the broad transverse bands of bluish-gray, which remain more or less distinct until late in autumn. I have seen these young rock-fish as late as October 13, $4\frac{1}{2}$ inches long, with these transverse bands still quite perceptible, although not as clearly defined as in individuals of but half that size. These young rock-fish do not content themselves with feeding exclusively on young minnows, such as young *Hybopsis bifrenatus* or *H. procne;* but when they reach a size of 2 inches or but little more, will readily seize a minnow as large as themselves, and, with a large proportion of the captured fish protruding from its jaws, swim about for several hours before rid of the annoyance, as it seems to be. Size for size, young rock-fish are more voracious than young pike.

It is a question whether the objections that have been so generally raised against the pike are not equally applicable to the rock-fish, and if it is not really undesirable to increase their numbers. That this can be done there is no doubt whatever, as gravid females are easily obtained. For stocking inland still-water ponds it is not suitable, and, all things considered, where it would thrive it is not as desirable as the popular black bass.

To return to the river: If it is desirable to have an abundant supply of shad and herring in the Delaware, then the rock-fish should be kept down rather than protected with a view to its increase, for the ravages they commit in August and September upon young shad, I am convinced, is equal to the destruction caused by dams, fish-baskets, and illegal fishing together. Perhaps I may err in this, but there can be no doubt but that the chief natural enemy of the shad is the rock-fish.

The rock-fish is easily captured with a hook and line, especially if some care is exercised in selecting the bait. A minnow is the best bait that can be used. In "trolling" for them in the Delaware, a silver spoon-shaped disc, such as is used in blue-fish fishing, answers very

well. Also a strip of bright red flannel attached to the shaft of a hook has been used with success.

In summer (after June 15) they are sometimes caught in considerable numbers with an ordinary draw-net; and during the shad and herring season (ending June 10) occasionally large specimens are taken in the shad-nets; but they are, I judge, most numerous from July 1 to October 15, especially during the months of August and September. Small specimens, *i. e.*, 6 to 10 inches in length, are found associated with white perch, and in a catch of these with a line there is sometimes 10 per cent. of rock-fish, but usually not more than half that proportion. In the tide-water creeks they are caught most abundantly just at the turn of the tide, that is, as the high waters begin to recede.

Rock-fish, both large and small, are always in demand, and readily bring a good price, even when other kinds of fish are offered. Those taken from the Delaware are really a better table fish than those from the sea; but the great majority of the fish weighing over 5 pounds come from salt water. The price per pound varies from 12 to 16 cents.

4.—WHITE PERCH, *Morone americana*.

This fine fish is known only by the one name of "white perch." In the Delaware River it must be looked upon as an anadromous fish; but many ponds are now stocked with them, and these land-locked fish flourish so well, that it is probable that a few, at least, remain in the river throughout the whole year. When an open winter occurs, they are caught in the deeper waters of the tide-water portion of the river throughout the whole year. In ordinary seasons, the great bulk of these fish are found in the river from May till October. During the early part of the summer, they are principally found in the deeper portions of the river, within tide limits. As late as June 10, I have found female fish heavy with apparently ripe ova. Exclusive of the cyprinoids, and the shad and herring in their season, this perch is the most abundant of our river fish. I am disposed to think that their numbers exceed those of even the river sun-fish, (*Ichthelis appendix*). The abundance, however, of large perch, say of one pound weight, has certainly decreased during the past thirty years fully one-half. It would seem as if the perch of that size had found more attractive breeding-grounds elsewhere, and that only the smaller and weaker breeding-fish frequented our waters.

The largest specimens of white perch taken in the Delaware, that I have accurate knowledge of, weighed, respectively, 1 pound 9 ounces; 1 pound 13 ounces, and 2 pounds 1 ounce. These were caught in a shad-net, in May, at the fishery opposite Trenton (Lamberton), in 1865. The average adult fish may be said to measure 8 inches and weigh from 7 to 9 ounces.

I believe, for reasons to be given, that the growth of the young is very rapid, and that the August perch are young hatched late in the pre-

ceding May and early in June; these August perch measuring about 2½ to 3 inches in length.

There is little, if any, variation in the coloration or shape of the two sexes, except the greater prominence of the abdomen of the female fish at the time of their arrival in spring.

My experience with reference to their arrival in spring wholly contradicts itself, comparing year with year, and the most I can determine is a *certain* amount of *uncertainty* in the time of their spawning. This, of course, is affected somewhat by the character of the season, but, without having ever seen the ova, after being deposited by the parent fish, I should judge that spawning occurred between May 10 and June 10, usually nearer the former than the latter date. This is based on the fact of having gathered very young fish, the age of which I *guessed* from the general condition and amount of development of the specimens.

After the middle of June the white perch are found in localities widely different even quiet waters, with a dense growth of lily and river-weed are found to contain them in apparent health and vigor; spots where the rock-fish could not live a day. Still later in the summer, as the young perch become quite strong and of some size, the river, both in and above tide-water, fairly teems with them. At this season they go in schools, sometimes of large size. I have known of twelve, fif een, and twenty dozen August perch being taken with a line in as short a time as from three to five hours. Fishing in this way, a line with half a dozen hooks is used, and worms, sturgeon spawn,* or live minnows used as bait. These schools of small perch I suppose to be broods of the preceding May, and that they keep together until late in November they pass down to the salt-water and there separate. The larger—adult—fish are not as restless as these smaller ones, and are found in deeper water, and usually the tide-waters. In their feeding habits the white perch agrees very closely with the rock-fish. In all their habits, in fact, the two fish are very much alike, and in the Delaware they are always associated; the most noticeable difference in their habits being the ability of the perch to remain and thrive in warmer waters than the rock-fish is ever found frequenting.

As an article of food, this fish is certainly popular, and I can scarcely think it merits the terms of "dry," "tasteless," "chippy," frequently applied to it. Those brought from the sea-coast, in winter, are not as good fish as the same sized fish caught in the river at other times of the year. Notwithstanding the objection of their diminutive size, I am inclined to think the August perch the best, and am not alone in this, as they command very ready sale in our streets, being hawked about in barrows, and not sold in markets.

5.—Black Bass, *Micropterus salmoides.*

As is now well known, this valuable fish has been successfully introduced into the Delaware River and its several unobstructed tributaries.

* Sturgeon ova are frequently kept in weak alcohol and water for this purpose.

During the summer of 1873, I found the young bass, 1 to 3 inches in length very abundant in both the river, and the feeder of the Delaware and Raritan Canal. They were associated with the myrinds of small cyprinoids and the barred minnow (*Fundulus multifasciatus*). The larger specimens were more abundant, apparently, in the canal than in the river. They snapped at the hooks continually while I fished in certain "holes" in the canal for specimens of rare cyprinoids, and seemed to have no fear about them, but took the hook a second and third time. A specimen caught in this way, I think for the fourth time, had its mouth so injured that I killed it. Its stomach on examination proved to have the remains of seven minnows (*Hybopsis*), besides a large grasshopper, within it. The specimen measured just 3¼ inches.

During the past summer, I have seen fewer very small bass, but several specimens much larger than those seen by me in 1873 were taken, with a hook and line, at several points below Trenton, N. J. This fish can be fairly considered as established in the Delaware River.

6.—Goggle-eyed Perch, *Pomoxys hexacanthus.*

A few specimens of this fine perch are caught every summer in the Delaware River. As the first specimens that I met with were adult, I concluded that they were purely "accidental"; mere stragglers as it were from their proper habitat. In the summer of 1873 they were more numerous, and I found several quite small specimens; so it is quite certain that a supply of them has been received from some locality, but how or when, I have no knowledge. It may be possible that they could reach the Delaware River through the Delaware and Chesapeake Canal; but I merely make the suggestion, knowing them to be a southern species. They are frequently offered for sale in the Trenton markets, as single specimens received with other fish. As an article of food, they rank with white perch and rock-fish of the same size.

7.—Sunfish, *Pomotis auritus.*

River-sunfish, *Ichthelis appendix.*

Blue sunfish, *Ichthelis incisor.*

Spotted sunfish, *Enneacanthus guttatus.*

Banded sunfish, *Mesogonistius chætodon.*

Mud-sunfish, *Acantharcus pomotis.*

The above list comprises the several species of the popularly-called "sunfish," or "sunnies," that frequent the river and our various small ponds and creeks. There is what I believe to be a well-marked variety also found in the Delaware of the *I. appendix;* of more ruddy hues, the *I. rubricauda* of Holbrook, and the "spotted sunfish," may prove to be the *obesus* of Girard, or that may be distinct from the *guttatus* of Morris, which is very abundant in our smaller streams.

There is not one of the above list that has really any economic value,

either as a food-fish or as a fish for fish to feed upon, a consideration that should be taken into account in considering the value of a species, even though very small. The reason that the black bass are so thoroughly established in the Delaware River is largely due to the enormous amount of food attainable in the countless schools of small cyprinoids.

The common sunfish (*Pomotis auritus*) is too well known in all respects to require any detailed account of it. It is uniformly abundant in all waters, unless there be a rapid current, and therefore, even in the quieter portions, it is not as numerous in the river and certain tide-water creeks as the following species, *Ichthelis appendix*. The common sunfish does not attain the size and weight here in New Jersey that it does in the Great Lakes and some localities north of us. As usually found in our ponds, creeks, and mill-ponds, it seldom measures over 6 inches in length. Of that length, and even smaller, while considered a fair "pan-fish" by many people, still it can scarcely be considered of any economic value, although, when of the very largest size, they are brought to market, especially in winter, when better kinds of fishes are scarce. They never command a higher price than 10 cents per pound, and more frequently are offered at 6 and 8 cents. My own opinion is that they are, big or little, a very indifferent article of food.

The river-sunfish (*Ichthelis appendix*), like the preceding, is too well known to need any reference to its habits. It is well known in this neighborhood among the more intelligent fishermen as the "black-eared sunfish", so called from the marked size of the opercular flap; and by others it is called the "ruddy-rudder", from the dull-red color of the tail. The most noticeable feature in the habits of this species, as compared with the preceding, is that it is more of a running-water species, being found in the river in great abundance, and in those small streams that have a decided current.

As is well known to ichthyologists, this sunfish has been called by Holbrook, in his work on the South Carolina fishes, the *Ichthelis rubricauda*, a specific name that well describes a marked feature of coloration. In examining a large series of these fishes from the river and various creeks, I have been convinced that the fish called *Pomotis appendix* is the same as that called *rubricauda* by others. In some localities the *P. auritus* is a dull yellowish-brown, darker upon the back, but having no trace of red upon the belly or the caudal fin. In the river, the red tints are noticeable even in small specimens. Comparing these extreme examples, one would readily conclude that they were different species; but the gradation from the plain to the gaudy coloring is so regular that I believe the two to be merely varieties of the one species.

The blue sunfish (*Ichthelis incisor*) is quite new to our fauna. In February of the past year (1874), I succeeded in procuring, in the Delaware River, at a short distance below Trenton, in the tide-water, five fine specimens of this southern and western species, known elsewhere, I believe, as the "copper-nosed bream." Learning that Mr. Richard Bliss, jr., of Cambridge, Mass., was engaged upon a monograph of the *Ich-*

thelidæ, I forwarded the specimens to him, and give herewith extracts from his two letters concerning them. He wrote me, "Three specimens are *Ichthelis incisor* and two *Pomotis auritus*. I am astonished at finding *I. incisor* in the Delaware, and congratulate you on your discovery." A few days later, having sent additional specimens, he wrote, "They are, both of them, fine specimens of *I. incisor*, and I think you have established the fact of their occurrence in the Delaware River, as these, with the three, make five from your place—an unusual number if they were stragglers."

During the past summer I was not able to find any additional specimens; but from a description of a "peculiar sunfish" given me by an observing friend, I am satisfied at least one other was taken in August last, while fishing for white perch. If such really was the case, it makes the sixth specimen from the Delaware, and, curiously enough, the locality whence the supposed sixth specimen was taken was within a hundred yards of that, where I procured the five specimens forwarded to Mr. Bliss.

The spotted sunfish (*Enneacanthus guttatus*) is well known throughout central New Jersey, and is as abundant in the small weed-choked streams as the first two of our list are numerous in the clear ponds and the river. In an article on our fresh-water fishes, published in the American Naturalist, vol. iv, p. 386, I considered the little sunfish described by Dr. Morris, as *Pomotis guttatus*, as distinct from *Bryttus obesus* Girard; and since then, I have found, in some small streams, a great abundance of specimens identical with the description of *Bryttus obesus* given by Baird in the Smithsonian Annual Report for 1854, p. 324; and at other times, in other creeks, and occasionally in the river, collected many dozens of fish, I am sure are identical with Morris's *P. guttatus*. As alcoholic specimens, the two species (?) cannot be distinguished; but when living, there is a variation in color, but scarcely so decided as to warrant Professor Cope in saying of the two supposed species, that they are "readily distinguished in life." As in the case of *Ichthelis rubricauda* and *appendix* I find a gradual merging of one style of coloration into the other, and separate the two varieties or species, as I understand them, by the *guttatus* having the anterior rays of the ventral fin, pure white, opaque, and succeeded by two rays of jet black; the remainer of the fin being of a dull reddish hue; and by the anal fin having also this dull red tinge, instead of greenish, as in *obesus*. The spots on the body of the fish in *guttatus*, too, are a bright golden, and more numerous and irregular than the purplish dots on the *obesus*.

The banded sunfish (*Mesogonistius chætodon*), now very common, is well known from the demand for it for stocking small aquaria. It appears to be steadily on the increase in certain ponds and small creeks in Central New Jersey. I have since then noted nothing peculiar in its habits not already given in the fourth volume of the American Naturalist, and Hardwicke's Science Gossip (London) for February, 1872. This sunfish never reaches a greater length than three inches, and has no value whatever as an article of food.

The mud sunfish (*Ambloplites pomotis*) is not a well-known fish. Occasional specimens taken by "line" fishermen have made them familiar with the fish, and from the color of the species, and character of the water it frequents, it is well called the "mud sunfish." The mud sunfish appears to be, even more than most fishes, nocturnal in their habits; and from the fact of lying, during the day, wholly out of sight, embedded in soft mud, it does not seem strange that the species should be little known. Besides muddy streams, this fish delights in those half-stagnant waters that are completely choked up with splatter-docks, pond-lily, and river-weed. I once had the good fortune to observe a large specimen of this sunfish making its way toward deeper water through such a dense mass of aquatic vegetation that the greater part of the time it was absolutely out of water, and really creeping among the weeds by the aid of its ventral fins apparently, rather than swimming in the water. It progressed in this awkward manner fully 3 feet, keeping the head up and the body in very nearly as upright a position as when swimming. On examination I found a huge log deeply embedded in the mud, and less than half an inch of water flowing over it, and this barrier caused the sunfish to attempt, and successfully, the reptile-like movements that I witnessed. This fish is one of several of our fresh-water species that can utter, at will, a peculiar grunting sound, not unlike the faint squeak of a young pig. Occasionally I have caught this fish with a hook, and heard this grunting sound as the fish was drawn from the water. (This same noise, but less shrill, is very frequently made by the common chub (*Semotilus rhotheus*) when caught with a hook). On two occasions, I am positive, I have heard the same sound from the sunfish while it was swimming about, and wholly undisturbed by anything above the water, at least.

The mud-sunfish grows to a considerable size, attaining a length of 6 inches; but as an article of food it is very indifferent. The flesh is dry, and has a muddy flavor that to most people is exceedingly disagreeable.

8.—Pirate or Spineless Perch, *Aphredoderus sayanus*.

In concluding this portion of my remarks on our fishes, I will make brief reference to this species, which is probably the least known of all our fresh-water fishes. It is moderately abundant in some small streams in this neighborhood. I have already noted its habits, in the Proceedings of the Academy of Natural Sciences, of Philadelphia, 1861, and in the fourth volume of the American Naturalist. I have given it the name of "pirate," from the fact of its being such a murderous, destructive fish. Its food is almost, if not exclusively, small fishes, which it swallows head foremost; and I have caught them, several times, with the tails of fishes, too large to be swallowed whole, protruding from their mouths. They are also given to feeding on their own young, but I judge this to be the case only when pressed by hunger, through a scarcity of cyprinoids.

B—NOTES ON THE WINTER HABITS OF FRESH-WATER FISHES OF THE DELAWARE.

On the 26th of January I completed a detailed notice of our percoids, giving brief notice in some cases of the character of their winter haunts and habits. Since then I have been engaged in studying, with all practicable care, the winter habits of all of our common fishes; and two months of steady winter-weather have given me an opportunity to accomplish considerable, but whether my statements may be of value or not I leave you to judge; but many of the facts, at least, were new to me. At this time (March 23) it is still emphatically winter, the thermometer marking 15° Fahrenheit at sunrise, and remaining at or near freezing-point, except on the south sides of hills and such protected localities. There have been but few mild days, and the frogs have not "sung" once since last autumn—a most unusual occurrence. I give these few details to show the general character of the season; for I think that the fact of its being the severest winter, with possibly one exception, since 1780, makes it a very favorable one in which to determine the ordinary winter-habits of our fishes. I will give these notes just as I took them down in my field-book on the spot, and omit references to aquarial studies pursued in connection with field-work. These will appear in due time in one or more scientific journals.

February 12, 1875.—To-day I visited Watson's Creek, Mercer County, and experimented in fishing with a net placed under the ice. There were no means of disturbing the fishes, if simply "at rest" in or on the mud, and any that might be caught would be such as voluntarly were moving to and fro. On removing the net—a gilling seine—there was found to be a catch consisting of ten sunfish, (*Pomotis auritus*); one banded-sunfish, (*Mesogonistius chætodon*); one very large mud-sunfish, (*Ambloplites pomotis*); two catfish, (*Amiurus lynx?*); two mullet, (*Moxostoma oblongum*), and one adult roach, (*Stilbe americana*). The stream where these fish were caught is a shallow, weed-grown water-course, fed wholly by a few springs, traversing a broad expanse of meadow and emptying into the Delaware River, about one mile from its source. At several other points the net was placed, and, with the exception of an occasional mullet (*Moxostoma oblongum*) no other fishes were taken. On returning to the spot where I had in the first instance been successful, I placed the net again in the same position, and after a lapse of twenty minutes, took seven more sunfish and several mullet. A third trial yielded but one small catfish.

In the discovery, as it appeared to be, of the fact that these fishes were attracted to one spot which happily I chanced upon wholly by accident, and that throughout the channel of the stream there was no other collection of individuals that I could discover, I believe it to be true that while fishes when unable to escape from the effects of a severe

winter, will embed themselves in the mud and remain in a torpid or semi-torpid condition, they will, in preference(?), seek winter-quarters where the water is of such temperature that they can move freely about. If this is true, then it necessitates their being able to procure food; and what the vegetable feeders, as the suckers and cyprinoids, find in the lifeless and leafless waters, it is difficult to determine. I endeavored to clear up to my own satisfaction, at least, some of these points in connection with the "catch" of fishes above enumerated.

On examining the physical character of the locality itself, I found it to be a basin, about one-fourth of an acre in extent, about 4 to 5 feet in depth, and fully 3 feet lower than the surrounding bed of the stream. The ice at the time was 9 inches in thickness over the entire stream, so that there was a depth of running water of 15 inches in the stream generally, and in this basin a depth of water of from 2 to 3 feet and 3 inches. This deeper water was, near the bottom of the stream, warmer than that in the shallower places. In addition to the mere depth, there was a constant supply of fresh water from two vigorous springs which bubbled up with great energy, keeping the sand in a constant whirl. About these springs the vegetation was green and vigorous, if not really growing, as in summer. These "mats" of vegetation were favorite resting-places for the sun-fish; and I suppose the vigorous condition of the plants and the chemical changes in operation in them, even at this time, is an additional source from which the water procures warmth. Assuming, then, from this brief outline of the physical characters of the locality, that certain fishes, finding such spots, can resist the effects of even the coldest winters, it becomes a question of interest to know what is the character of their food at this time, and if they can exist on a much smaller quantity than is ordinarily consumed, or for a considerable period upon none, yet retain their ordinary vigor and condition. To determine something of these questions, I examined the stomachs and their contents, of each of the fishes above mentioned, 28 specimens, and with the following result: The common sun-fish had in each case a small amount, about one-fourth the capacity of the stomach, of mixed vegetable and animal matter; the former being diminutive fragments of the common river-weed (*Myriafilum obtusum*), and the latter, fragments of minute shells of several species determined by the pieces of the shell, and some entire shells of a species of *Ancylus*. I determined the character of these partially digested masses by placing each mass in a plate of water, and allowing the lump to slowly separate into distinct particles. With a pocket lens, the character of these floating fragments could be determined. There was no trace of a fish in the stomach of any one of these sun-fish, and yet small minnows are eagerly devoured by them during the summer months. Having determined the character of the animal food in the stomachs of the sun-fish, I sought for the winter-quarters of the shells, such as the fish had been feeding upon, but could find none on the living plants grow-

ing about the springs in the bed of the creek. They appeared to have all hidden themselves away for the winter; and the few I subsequently succeeded in discovering were met with by accident. These were upon the under side of a sunken, mud-embedded stick, at least 6 inches deep in the mud, and so snugly fixed in the cracks and crevices of the stick that I do not suppose a sun-fish could have burrowed down and picked from such inaccessible places the specimens I found. So far as my recollection serves me, I do not recall an instance of sun-fish feeding upon shell-fish in summer. These fish, it must be remembered, are strictly carnivorous from early spring until winter; and I judge that the amount of food taken in winter is really very small, and that they can "keep up their flesh," even if "active" throughout the winter, without any, or but very little. That found in the stomach may have been taken, not so much as food, but simply by its presence to satisfy the natural craving of an empty stomach; *i. e.*, supposing that in winter the active fish has its digestive organs in full operation, save the presence of food. If the stomach secreted its digesting juices as usual, it would be unhealthy, unless there was something in the stomach for it to act upon; and thus vegetable substances and small shells may be taken into the stomach, not for the nourishment they contain, but as a means simply of keeping the body in a healthy condition; the more necessary, perhaps, as the ova and milt are now maturing, and must be in a healthy state to produce normal offspring. I throw out this suggestion as to the cause of sun-fish eating vegetable matter in winter, as a possible reason for their so doing. It suggested itself to me during the course of my investigations, and will be made the subject of a special study during the coming winter.

The mud sun-fish was fairly out of shape with an enormous mupminnow which it had succeeded in swallowing. I could not make a careful dissection, but saw enough to convince me that the stomach and œsophagus are highly distensible. That portion of the digestive apparatus, or rather the bowel, not in use was literally pushed aside and almost out of sight. From specimens of this and other fishes kept in an aquarium, I have learned the fact, possibly of interest, that, like owls, this fish discharges by the mouth small pellets of bones and scales of the fishes it devours, as well as rejects, *ab ano*, the indigestible portions of its food.

The cat-fish (*Amiurus lynx*) I examined had in each case a small mass of greenish slime in the stomach, the character of which I could not determine. I have since examined many specimens taken from various localities, and find, at this time of the year, there is about the same amount of food in the stomach, and that the bowel generally is empty. From this I am led to believe that as to hibernation the cat-fish vary in the habit a great deal; and that the active individuals, throughout winter, take comparatively little and possibly no nourishment.

From a cruel experiment I tried a year ago, I am satisfied that this fish can live an unusually long time without food, and yet not lose weight. A specimen, weighing just one ounce, was placed in a glass jar, and at the end of eighty days was in good health and of the same weight, as near as I could determine by using the same scale and weight as at first. If there be truth in the supposition that fishes feed largely upon animalcula in the water, then a fish kept in the same tank of water that would gradually become darkened with the spontaneous generation of an abundance of animals and plants, would indeed find plenty of food, such as it was; but in the case of my imprisoned cat-fish, the water (pure spring-water) was changed every day, and I doubt not was absolutely free from everything that could nourish the fish had it been swallowed. As this and other species of cat-fish are well worthy of cultivation as a valuable source of food, the fact of its "easy keep" throughout winter should not be lost sight of. From the few experiments I have made, and facts I have learned with reference to the habits of the species, I do not hesitate to say that a pond of five acres in extent, having a depth of from 3 to 6 feet, will sustain in excellent condition cat-fish enough to yield, at least, 1,000 pounds annually of most excellent food.

The mullet (*Moxostoma oblongum*) is one of the most abundant of our fresh-water fishes, and the only sucker (*Catostomoid*) that remains in our smaller streams in abundance throughout the year. As an article of food, from May to November, it is certainly very indifferent, if not absolutely worthless; but, on the other hand, during the winter it is not really so unsavory as is supposed, and for this reason there is in it a source of cheap and abundant food of some value. No degree of cold seems to affect the movements of this species, and hundreds can frequently be seen under the ice moving slowly along the bed of the stream, feeding upon the wilted remnants of pond-lily and splatter-dock plants. One of the two specimens that I examined had in it a fragment of calamus-root, and nearly thirty statoblasts of the common polyzoon, (*Pectinatella magnifica.*) This sucker has, I think, a value which has as yet been overlooked, and that is as a source of food for black bass and other carnivorous fishes. They deposit such enormous masses of eggs, and in such shallow, weedy water, that the ova, until hatched, are protected from the predaceous fishes; afterward, as young fish, they swarm the stream by thousands, and are readily snapped up by the bass. This applies also to our common roach (*Stilbe americana*), which, to less extent, braves the chilling waters of our streams throughout the winter, and, in consequence, suffers from the persecutions of the three species of pike (*Esox reticulatus*, *fasciatus*, *porosus*) inhabiting our streams. I shall refer again, in more detail, to the value of Cyprinoids as sources of food for cultivated food-fishes in another communication.

On the 22d of February, a bright, warm day, I placed a small net in a brook fed by several springs, one of them largely charged with sul-

phur. The vegetation was quite green beneath the water, and probably had been so throughout the winter. I caught seven specimens of the ditch-pike (*Esox porosus*) and a vast quantity of the common mud-minnow (*Melanura limi.*) These two species seemed to be the principal inhabitants of the brook, and, as I expected, the pike each contained in their stomachs a partially digested mud-minnow. Three of the pike proved to be females, and were heavy with a considerable mass of orange-colored eggs, which were nearly matured, I should judge. They were adherent, in three separate masses, and comparatively few in number. An ovum measured $\frac{1}{30}$ of an inch in diameter.

The largest specimens of the mud-minnows I preserved in an aquarium for special study, since completed. I made several dissections of the smaller ones, and found in three, out of twenty examined, very small specimens of their own kind. Cannibalism among fishes is very common, however. The seventeen other specimens were without food, so far as I could detect. The specimens in my aquarium remained without food for two weeks, when the two very large ones devoured their smaller companions. These mud-minnows are wonderfully abundant and very prolific, and, like the cyprinoids, are valuable as a source of food for the pike and various percoids.

This covers the range of my observations made since the 1st of February. There are indications now of spring fairly opening very soon, when I will commence an investigation of the breeding habits of our river fishes generally.

V.—METHOD OF PURIFYING THE RESIDUUM OF GAS-WORKS BEFORE ALLOWING IT TO PASS OFF INTO THE WATER.

By J. R. Shotwell.*

Rahway, N. J., *May* 29, 1877.

My Dear Sir: At our recent meeting in New York you requested me to write you a description of the process by which the Rahway Gas-Light Company eliminates the offensive and injurious portions of the residual products resulting from the distillation of coal, in the manufacture of gas, before allowing them to pass off into the river. Our works are on the margin of a small stream, a branch of the Rahway River, whose banks, for nearly a mile below the works, are occupied by residences, and several streets cross it by bridges. To avoid the annoyance to the community caused by the overflow from the tar-wells, we built supplemental wells to receive and hold the ammonia-water and light oils that constitute the overflow. Valves with long rods reaching above the surface were placed at the bottoms of these wells, and the men in charge of the works were directed to open the valves after midnight so that the offensive products might be carried off by the current before morning. This plan did pretty well while the works were very small, but as the quantity of gas made increased, the refuse necessarily increased also, and complaints multiplied against our defilement of the waters.

About two years since we adopted a plan, at the suggestion of Mr. George W. Edge, of the Jersey City Gas-Light Company, of straining the overflow through a mass of the finer particles of coke, technically called "breeze," before allowing it to pass into the river. This has proved completely successful.

The accompanying drawings and descriptions will show the simple and inexpensive method of accomplishing the very important result of removing the deleterious matter from the ammonia-water before it is allowed to flow into the river. We have one tar-well at the retort-house and another at the purifying-house, each one having its supplemental well. These wells have been adapted to the new process I have described by merely dividing them by a horizontal partition, as shown in the drawings. It will readily occur to any engineer of gas-works that the same process could be carried out in various ways.

One remarkable feature in our experience in this matter is that we have never changed the breeze since it was first put in. We pump out

* Commissioner of fisheries of the State of New Jersey and president of the Rahway Gas-Light Company.

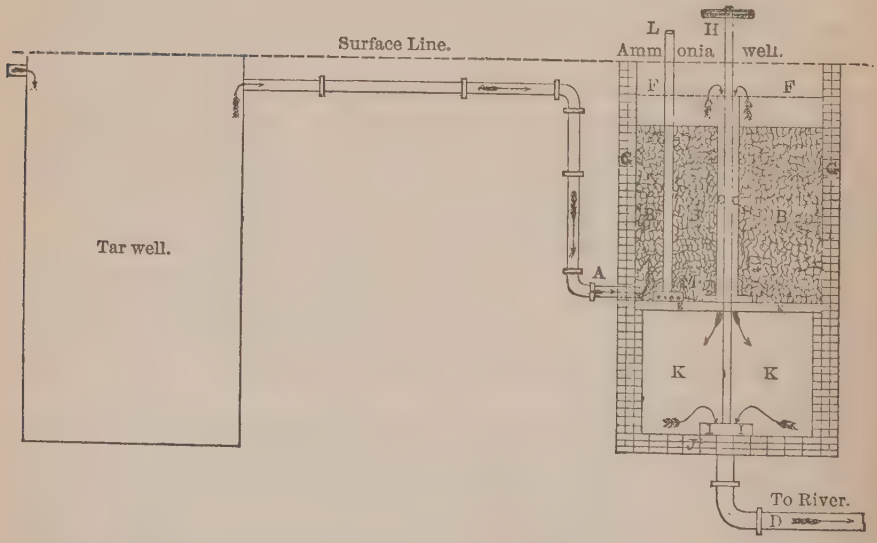
the "dead oil" that accumulates at the bottom of the upper section of the well about once a month, and that is all the care we give it. The valves at the bottoms of the wells are now left open, and the ammonia-water, freed from the "dead oil," light tar, and all insoluble matter, is allowed to flow into the river as fast as it is made. It is evidently soon diffused, and produces no bad effects upon the fishes that constantly sport in the water, near the outlets of the wells, nor is it noticed by the dwellers on the banks of the streams.

If my explanations and drawings do not make the case clear to you, I shall be glad to endeavor to elucidate any obscure parts, and to show you, or any one interested, the actual working of this simple but very efficient device.

I am, very respectfully and truly, your friend,

J. R. SHOTWELL.

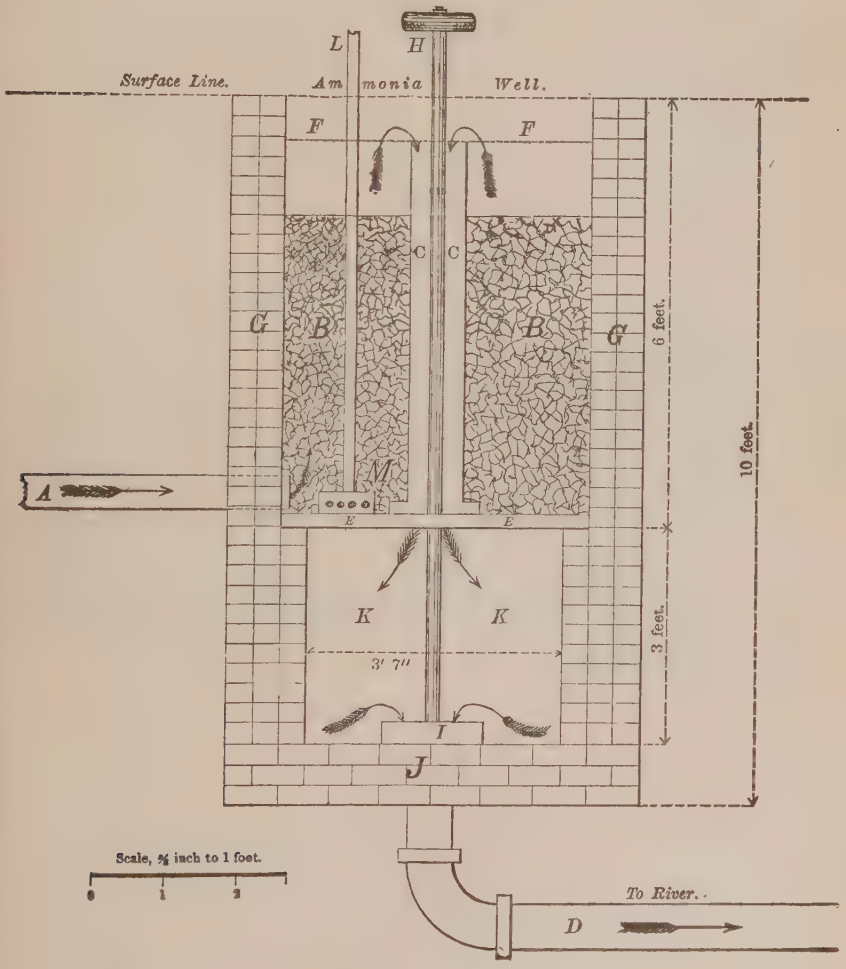
Prof. SPENCER F. BAIRD,
United States Commissioner of Fish and Fisheries,
Washington, D. C.



A is the inlet to well. *B* is the space filled with coke and breeze through which the ammoniacal liquor passes upward, leaving the insoluble matter in the interstices of the coke. The water containing ammonia and other soluble salts passes to the top *F*, and descending down pipe *C* to chamber *K*, and then out through valve *I* and pipe *D* to river. The wall *G* is two bricks thick from the top to *E*. From *E* to *J* it is three bricks thick, to form a ledge for bottom, *E*. *J* is the bottom of the well, three bricks thick. *E*, the bottom of the upper section *B*, is made

of two-inch plank, covered with two inches of cement. *F* is the overflow-line. *C* is the overflow-pipe, with flange at bottom bolted to *E*, and covered with cement to make it water-tight. *H* is the iron rod with wheel at the top to turn valve *I*. *I* is the valve and box, laid in cement, over discharge-pipe *D*. *K* is the lower section of the well, which receives the ammoniacal liquor before it is discharged out of pipe *D*. *L* is the pipe through which the tar and oil are pumped from the bottom of section *B*. *M* is the chamber or box perforated with small holes at the bottom of section *B* to collect the tar and oil from the breeze so that it may reach the pump-pipe *L*.

For the sake of greater clearness, we give an enlarged view of the ammonia well.



VI.—TABLES OF TEMPERATURES OF AIR AND WATER AT SUNDRY STATIONS OF THE UNITED STATES SIGNAL OFFICE, FROM MARCH, 1874, TO FEBRUARY, 1875, AND FROM MARCH, 1876, TO FEBRUARY, 1877, INCLUSIVE.

In view of the great importance of accurate data in regard to the varying temperature of the water of the rivers and lakes of the United States, in connection with the introduction of different kinds of new fishes, application was made to Brig. Gen. A. J. Myer, chief signal-officer of the United States Army, to cause observations on this subject to be made by the persons attached to his service and distributed throughout the United States. With his usual readiness to render all possible aid to scientific and practical inquiry, General Myer caused blanks to be prepared for the record of the observations in question, and forwarded them, with a suitable thermometer, to the various stations, and has since sent copies of the returns to the office of the United States Fish Commission.

The first of the two Wood's Hole, Mass., series of observations has been kindly furnished by the Light-House Board.

These returns for two years, from March, 1874, to February, 1875, and from March, 1876, to February, 1877, have been reduced and digested by Mr. H. Jacobson, and are herewith appended. They show the results of observations at fifty-four stations, respectively, and give tables of the mean temperature of the air at 3 o'clock p. m. for each month, the mean temperature of the water at the bottom of the stream at 3 p. m., as also the absolute maxima and minima of the bottom temperature for the same period.

These records are more or less imperfect, and must not be taken as being more than an approximation to the actual condition of the water during the period mentioned.

SPENCER F. BAIRD.

APPENDIX C.

THE PROPAGATION OF FOOD FISHES.

VII.—THE CARP AND ITS CULTURE IN RIVERS AND LAKES: AND ITS INTRODUCTION IN AMERICA.

BY RUDOLPH HESSEL.

A—INTRODUCTION.

The present article is intended to give a brief description of the well-known carp of Europe, its nature, way of living, its ratio of natural and artificial increase in open waters, rivers, and lakes, the most approved methods of its culture, and the proper construction of ponds and breeding establishments. An additional object in view is to draw attention to the introduction into the United States of this valuable fish, as specially adapted to its needs.

B—THE RACES OF CARP—THEIR HISTORY AND HABITS.

1.—The species and varieties.

The carp, *Cyprinus carpio*, of the family *Cyprinidæ*, has a toothless mouth, thick lips, and four barbels on the upper jaw. In place of the usual teeth of the mouth there are a number of stout teeth on the pharyngeal bones, which are arranged in three rows. It has one single dorsal, which is longer than the anal. Both these fins have at their origin, on the anterior edge, a strong ray, which is serrated in a downward direction. The caudal is of semi-circular shape, and the natatory bladder is divided into two sections, with connecting air-passage. The scales have an entire edge, and the body is compressed on the sides. The general color of the back and sides is a dark olive-brown, the abdomen often of a whitish-yellow or orange tint. The coloring depends, as with all fishes, partly upon the age and season, partly upon the water, the soil, and also upon the food of the fish.

Be it remarked that the carp, which has occasionally been compared to the buffalo-fish, has no resemblance to it, with the exception of the similarity of their coat of scales; neither does the flesh of the buffalo-fish ever come up to the excellence of that of the carp.

The carp was, in all probability, originally introduced into Europe from Central Asia many centuries ago, and is now common in most of

the large rivers. In some parts of Europe, principally in Bohemia, Austria, Southern, Central, and Northern Germany, it has become domesticated.

The carp is alleged to have been imported into England in the year 1504. In Austria, which possesses the most extensive carp-fisheries in Europe, the culture of the carp can be traced as far back as the year 1227. The Emperor Charles IV of Germany, by granting sundry privileges, favored the establishment of ponds in his dominions, and the monks were especially assiduous in the culture of fish in ponds. As early as the first half of the fourteenth century, Bohemia had its first large carp-pond, and the culture of this fish progressed in that country, as also in Poland and that district which now comprises German Austria; also in Upper Lusoatia, Saxony, Silesia, and Bavaria. A celebrated establishment for carp-culture, with large, extensive ponds, was located, as early as the fourteenth century, near the town of Wittingau, in Bohemia, Austria. The first beginning of it may be traced back to the year 1367. At that time the Lords of Rosenberg called into existence and maintained for centuries these establishments on a scale so extensive that to this day they are the admiration of the visitor, the main parts having survived, while the race of the Rosenbergs has long been extinct.

The manor of Wittingau suffered greatly from the calamities of the Thirty Years' War, and with it, in consequence, its fish-culture. The latter only recovered the effects of it after passing, together with the large estate of a rich monastery of the same name, in the year 1670, into possession of the Princes of Schwarzenberg, their present owners. The extent which carp-culture has reached on these princely domains will be seen from the circumstance that their artificial ponds comprise an area of no less than 20,000 acres. The proceeds amount to about 500,000 pounds of carp per annum. The ponds of the Princes of Schwarzenberg are probably the most extensive of the kind on the globe. They are usually situated in some undulating-lowland country, where small valleys have been closed in by gigantic dams for the purpose of forming reservoirs. Similar establishments, though not equally extensive, are found in the provinces of Silesia and Brandenburg; as, for instance, near Breslau and Cottbus, in Peitz and Pleitz, which I visited last year. In Hesse-Cassel, Hanover, Oldenburg, Mecklenburg, and Holstein there are also many hundreds of ponds, none of them covering more than a few acres, but almost every large farm possessing at least one of them.

It will be easily understood that after such an exclusive culture in ponds, continued through centuries, as also an existence in open water, where the *Cyprinidæ* were left more to themselves, a number of varieties or rather genuine species *Cyprinus carpio*, showing striking differences from the races were developed: these races, though derived directly from the original type, just as with our domestic animals. They are divided into three chief groups:

1. *Cyprinus carpio communis*, the scale carp; with regular, concentrically-arranged scales, being, in fact, the original species improved.

2. *Cyprinus carpio specularis*, the mirror carp; thus named on account of the extraordinarily large scales, which run along the sides of the body in three or four rows, the rest of the body being bare.

3. *Cyprinus carpio coriaceus, sive nudus*, the leather carp; which has on the back either only a few scales or none at all, and possesses a thick, soft skin, which feels velvety to the touch.

The two last named are distinguished from the original form by a somewhat shorter and stouter, but more fleshy body. It is rather difficult to decide which of these three species is the most suitable for culture. There are some districts where only scale carp are bred and mirror carp are not valued, as there is no demand for any but the former in the market, as, for instance, in Bohemia, in the above-mentioned domain of Wittingau. Again, in other districts, as in parts of Bavaria and Saxony, &c., for the same reason, mirror carp or leather carp only are bred. There is, in fact, no sufficient reason for making any distinction among these three varieties, for if they are genuine types of their respective species they are indeed excellent and desirable fish.

The assertion which has been made at times that the scale carp is better adapted for transportation than either the mirror or leather carp by reason of its coat of scales, which would protect it more efficiently from the accidents incidental to transfer, as also against inimical or hurtful attacks in the ponds, (the mirror carp having very few and the leather carp no scales,) is not correct. In transportation scales are not only inefficient for protection, but they frequently cause the death of the fish, especially in transporting the so-called breeding-fish, for if a scale be torn off in part only ulceration will ensue, and the fish, of course, will die. Again, should any scale be lost the bare spot will very soon begin to fester or develop a confervaceous growth and the consequences will be the same. On the contrary, the leather carp, which, oddly enough, like the frog, is destitute of covering, will bear a great deal more ill usage and injury, whether young or old, than the scale carp. The smooth, slippery skin of the leather carp suffers much less from friction during transportation than the scale carp, and any slight wound will heal up much more easily, as the epithelium will cover it immediately and the formation of a new skin can progress under its protection. I have often had the opportunity of seeing such scars upon the skin of the mirror carp and even more so on that of the leather carp. They are the effects of an injury from the sharp edges of the heron's bill, the bite of a pike, or some other hurt, and I never saw anything of the kind on a scale carp, for if one of these be wounded it almost invariably dies.

The carp will sometimes cross with some related species of the *Cyprinidæ;* for instance, *Carassius vulgaris;* and, in consequence, hybrids have been engendered, which sometimes resemble the genuine carp so much that it is often difficult for the student as well as for

the professed culturist and experienced fisherman to immediately recognize them. Such fishes are valueless as food, on account of their bad and very bony flesh. One of the hybrids mentioned is the *Carpio kollarii—Cyprinus striatus*, which was formerly regarded as a separate species. It is a cross between the carp and *Carassius vulgaris*, (crucian carp), a very poor and bony fish, which, in Germany, is sometimes called "poor man's carp." Some varieties exist of this common fish. The latter has even been dignified by a specific name of its own, *Carassius gibelio.*

The spawning seasons of the crucian and the true carp coincide, and, where kept together, hybrid races may readily be formed; that period including the time from the month of May until August.

In order to determine this question, I myself managed to bring about such crosses by placing (1) female common carp with male crucian carp, and (2) female crucian carp with male common carp, in small tanks, constructed with this end in view; (3) I also put together female *Carpio kollarii* with male common carp; this for the sole purpose of testing the capability of propagation of the *C. kollarii*, which had been doubted. In the two former cases I obtained forms analogous to the *Carpio kollarii* sometimes approaching in appearance the true carp, at others the crucian carp. In the third case, however, having placed ripe *Carpio kollarii* together with *Cyprinus carpio*, I obtained a product with difficulty to be distinguished from the genuine carp. I took the trouble to feed them for three years, in order to try their fitness for the table, but their flesh was exceedingly poor and very bony and could not be compared by any means to that of the common carp.

Considering, then, the whole extensive tract of country devoted to fish-culture in Central Europe, where crucian carp are to be found from Italy to Sweden and Norway, from France to the boundary of Eastern Siberia, considering the many who cultivate on a small scale and the owners of badly-stocked ponds, with their different doubtful productions, how often do we find in the markets or ponds very nice crosses which have been propagated through from three to ten generations and which are sold for carp! There are many small sheets of water in Germany, France, Austria, Italy, Holland, and Belgium, and probably also in England, the proprietors of which imagine, in good faith, that they have stocked their ponds with good, genuine carp, which, in reality, through careless selection or ignorance, are hybrids which may even have been cultivated for two or three generations. In some ponds in Switzerland, near the lake of Constance, some crosses of *Abramis brama* were found as late as twenty years ago.

2.—The habits and the mode of reproduction.

The carp is partial to stagnant waters, or such as have a not too swift current, with a loamy, muddy bottom and deep places covered with vegetation. It inhabits now most of the larger and smaller rivers of Europe, particularly the Elbe, Weser, Rhine, Danube, Po, Rhone, Ga-

ronne, Loire, then the Bavarian and Swiss lakes, the lake of Constance, &c.; even salt water seems to agree with it very well. I have taken it in the Black Sea, where its weight often amounts to from 15 to 20 pounds. It is also found in the Caspian Sea in great numbers, and is known there by the name of *Sassan*.

It is an advantage that the carp is able to live in water where other fishes could not possibly exist; for instance, in the pools of bog-meadows or sloughs. However, it is not by any means to be inferred from this that the best locality for carp-ponds of a superior kind could be in such situations. The presence of too much humic acid is unfavorable to the well-being of the carp, as we shall see presently in the chapter upon the establishing of fish-ponds.

The carp lives upon vegetable food as well as upon worms and larvæ of aquatic insects, which it turns up from the mud with the head; it is very easily satisfied, and will not refuse the offal of the kitchen, slaughter-houses, and breweries, or even the excrement of cattle and pigs. I propose to enter further upon the subject of feeding it when I speak of its culture in ponds.

In the moderate zone, that is to say in Central Europe, the carp will, at the beginning of the cold season, seek deeper water to pass that period in a kind of sleep. This will sometimes occur as early as the beginning of November, if the winter should set in early; and it is to be remarked that they will retire at an earlier period in ponds than in rivers. They do so always in groups of from 50 to 100 and more. They make a cavity in the muddy ground, called a "kettle;" in this they pass the time until spring, huddled together in concentric circles with their heads together, the posterior part of the body raised and held immoveably, scarcely lifting the gills for the process of breathing, and without taking a particle of food. They do not take any food from the beginning of October, and continue to abstain from it, in some countries, until the end of March, and in colder districts even somewhat later. It will not answer, however, to depend on this habit when transporting them for propagation in the spring or winter time, more especially young carp one or two years old. The fish will arrive in a worn and hungry condition, and must be kept in a tank constructed on purpose for observation, where it has no chance to bury itself in the mud; here it will sometimes take a little food. At such times I generally make use of boiled barley, or rye flour converted into a kind of tough paste by the addition of hot water, and with this I mix a little loam and rye bread; but I continue the feeding only until I can judge from the looks of the fish that they have recovered. This method I followed with the carp which I imported from Europe for the purpose of breeding in the winter of 1876–'77. It is a most striking fact that the carp, though it does not take any food during this winter-sleep in its natural retreat, does not diminish in weight, while, in the so-called "winter-chambers," it does so to a remarkable degree. These "winter-chambers" are large tanks 1,000 to 5,000 square feet in size or less; they

are sometimes walled in with masonry, sometimes they are constructed of wood. Fishes intended for sale are kept in them for a few weeks or months during the winter.

The carp does not grow in the winter. Warmth alone seems to exercise a favorable influence upon it and to promote growth. It only grows in the months of May, June, July, and August, and does not appear to continue doing so in September. The slight increase in weight which takes place during the latter month seems to grow out of an accumulation of fat which is being deposited around the entrails. In ponds which contain plenty of food and healthy water, in an ordinary year, the growth and increase of weight in the year will be represented in figures as follows:

	Per cent. of original weight.	Per cent. of growth
May	10–15	13
June	33	31
July	36	34
August	20	18
September	6	4
Total	110	100

If the weather in the month of May be mild and warm from the beginning, a better growth may be expected, amounting, as in June, to about 30 per centum. This month (May) is decidedly of great importance for the growth of the fish during the current year, for, in proportion as the fish has grown in the short space of one month, it will take more food in the following ones as the increase of its growth and consequent wants will demand. Culturists, therefore, consider the month of May as being the most important of the whole period of the carp's growth. The above-given calculations, of course, are limited to ponds in which no artificial feeding is resorted to, but in which there is sufficient food by reason of the good quality of the water and soil which produces it.

In small ponds, situated in parks or gardens, which possess favorable soil and river-water, the increase of weight will be even a little greater if feeding is had recourse to, for such small ponds (covering only half an acre) cannot produce sufficient food themselves. On the whole, feeding is a make-shift, as will be seen presently, and which in very large ponds of more than from 20 to 1,000 acres should not be made use of.

The above calculations are only admissible for Central Europe, from the Adriatic to the Baltic and the North Sea; in countries further north, as in Sweden, the growth of the carp is less, as, on the contrary, in more southern countries than Central Europe, for instance in Illyria, Dalmatia, Southern Italy, Southern Spain, and partly, also, Southern France, the result is more favorable still. There a milder and warmer climate, an early spring, a very warm summer and autumn, and a late winter which, in addition, is mild and short, combine to exercise a favorable influence upon the thriving condition of the fishes.

In these warm climates the fish becomes lively at a much earlier season, if it does at all pass the winter in that lethargic state, without taking any food, than it does in the countries of the northern parts of Central Europe.

The pond-carp of Central Europe generally leaves its winter retreat when the rays of the spring sun have warmed the water thoroughly, while at the same time it begins to seek for food at a somewhat earlier period in rivers and lakes. At the beginning of the month of March the eggs have developed themselves considerably in the body of the fish, and it only needs a few weeks of warm weather to bring about the spawning-season. This commences in the middle of May in such lakes and ponds of Central and Northern France, Southern Germany and Austria as have a warm situation and are sheltered from the cold winds. It continues in some localities throughout June and July, and sometimes, in more elevated situations, until August, as, for instance, in Franconia and Upper Bavaria. The spawn of so late a season, however, is scarcely fit for breeding purposes, as the fish cannot grow much more during the short space of warm weather. It remains very small and suffers greatly from the ensuing winter weather, and is easily dwarfed at that time. The spawning of the individual fish does not take place all at once. Days and weeks may pass before it will have left the last egg to the care of nature. At times, upon the setting in of rainy, cool weather during this period, it will be interrupted, but re-assumed as soon as the temperature grows warmer again. Culturists altogether dislike cold weather at this time, as not only the eggs but the young fry also suffer much from it. Wet, cold summers are no more profitable to the culturist of carp than to the agriculturist. In the southern part of Europe the spawning-season commences at an earlier date than in Central Europe. In Sicily, in the neighborhood of Palermo, where there are some private ponds, the carp begins to spawn at the commencement of the month of April. This is said to be the case also in the French province of Constantine, Algeria, Africa.

The abundance of eggs in the carp is very great, and it is this circumstance which will explain its extraordinary increase in the natural waters. A fish, weighing from 4 to 5 pounds, contains, on an average, 400,000 to 500,000 eggs. Other statements figure still higher. I not only made calculations myself, formerly, repeating them in 1876 on a female mirror-carp, which I obtained from the environs of Gunzenhausen Bavaria, and which, curiously enough, at the end of November, was entirely ripe, but I also obtained statements from culturists on whom I could depend. The calculation I made in the following manner. After freeing the eggs from all the fat, and the inclosing membrane, and after having washed them in alcohol, I counted off exactly 1,000 of them; these I weighed, and according to the result I deduced the number of the whole. In the somewhat longer-bodied scale-carp, I generally found comparatively more eggs than in a mirror or leather carp, though all were of equal age and weight.

During the spawning-season an appreciable change takes place in the male, protuberances, like warts, appearing on the skin of the head and back, and disappearing upon the expiration of that period. This is a peculiarity with most of the cyprinoids. Some time before the spawning-season sets in, the falling out of the pharyngeal teeth takes place; these grow anew every year.

Some days before spawning, the fish show an increased vivacity; they rise more often from the depths below to the surface. Two or three or more of the male fish keep near the female; the latter swims more swiftly on a warm, sunny morning, keeping mostly close to the surface, followed by the males. This is called "*streichen*,"=running-spawning, and is more frequent in warm than in windy and rainy weather. The female prefers spots which are overgrown with grasses and other kinds of aquatic plants, such as *Utricularia*, *Nymphea*, and *Alisma*. The male fishes follow close to the very water's edge, as far as the diminished depth will allow them. They lose all their timidity and precaution, so that they may be taken quite easily. They lash the water in a lively way, twisting the posterior portion of the body energetically, and shooting through the water near its surface with short, tremulous movements of the fins. They do so in groups of two or three males to one female fish, and forming an almost compact mass. This is the moment when the female drops the eggs, which immediately are impregnated by the milter. As this process is repeated several times, the female drops probably only from 400 to 500 eggs at a time, in order to gain resting time, so that it will require days and weeks before it has given up the last egg.

The eggs of the carp are adhesive, not detached, like those of the *Salmonidæ*, these latter lying loosely on the ground, while the former adhere in lumps to the object upon which they have fallen. As soon as the egg has left the body of the fish it swells up a little, the mucus, which surrounds it, serving as a means to fasten itself upon some aquatic plant, stone, or brush-wood. Those eggs which have no such object to cling to are lost. I found numerous eggs on the reverse sides of the leaves of the *Nymphaca* and their stems, the *Phellandrium* and *Utricularia*, but the greater number of them I discovered on the *Festuca fluitans*, which among fishermen is known generally by the name of "water-grass." Its narrow, long, strap-shaped, thin leaves spread softly over the water's surface, as also its numerous branches in the water afford to the fish the sought-for opportunity to depo sit its eggs upon its tender leaves. The seeds of this grass are an excellent food for the carp. This may be regarded as a useful indication to be acted upon in the construction of ponds.

The eggs will develop themselves quickly, if assisted by warm weather. As early as the fifth or sixth day the first traces of dusky spots, the eyes, will be visible, and toward the twelfth, or at the latest the sixteenth, day the little embryo fish will break through its envelop.

This rapid development takes place only in shallow, thoroughly-warmed ponds, or in such as were expressly constructed for hatching, and called breeding-ponds. If these ponds are deep, and consequently their water is colder, the hatching process may require as many as twenty days. In from three to five days the young fish has absorbed the yolks, and seeks its food. If the breeding-pond be productive enough to furnish the necessary food for so many young fishes, these will grow very rapidly. I shall return to this subject hereafter.

I remarked above that the carp prefers stagnant or slowly-running water with a muddy bottom, and that it lives upon vegetable as well as animal food, aquatic plants, seeds, worms, and larvæ of water-insects; it is therefore no fish of prey. It does not attack other fishes, and has no teeth in its mouth, but only in the throat, and is, on account of its harmlessness, an excellent fish for the culturist, as well as for stocking large lakes and rivers in general.

3.—The growth and size.

Its growth differs, according as the fish inhabits cold or warm water, a river, lake, or pond, finding plentiful food therein, or being fed. An additional factor is the quality of the soil, whether muddy or stony. In cold water, or such as has a stony ground, the carp will not progress favorably. For this reason, the statements concerning its normal size, attained to in a certain given time, differ widely. Very naturally, it will exercise an extremely great influence upon the thriving of the fishes whether the pond contains a great number or only a few of them; whether it is overstocked, as culturists term it, or whether there are only a proportionate number of fishes in it, according to its capability of producing food. Other considerations remain to be mentioned, namely, is the pond provided with supplies from brooks falling into it, or are the fishes to be fed? The latter course is almost indispensable in the culture of trout. The expenses incurred in this case diminish the income of the culturist; if not resorted to, the result will be the same, as the value of the fish will be smaller. This feeding is needless with the carp, if it be cultivated judiciously in suitable ponds, and for this reason alone the culture of the carp is preferable to that of the trout.

In rivers and lakes it grows larger, although the same fish; for the reason, probably, that in a larger space, which at the same time yields more sheltered retreats, it escapes from the pursuit of man more easily than in regular artificial ponds, and finds more plentiful supplies of food. The question of the species, or I would rather say the race, is of great moment, particularly in respect to carp-culture in ponds.

A favorable result may be expected from the culture of this fish wherever the necessary water is to be found, be it in the North or South, and that, too, as well in ponds as in open lakes and rivers.

The normal weight which a carp may attain to in three years, whether it be scale-carp, mirror-carp, or leather-carp, is an average of from 3 to

3¼ pounds; that is, a fish which has lived two summers, consequently is eighteen months old, will weigh 2¾ to 3¼ pounds the year following. The growth may turn out to be even more favorable in a warm year, or if only a few fishes have been placed in a pond, as we shall see farther on, in the chapter treating of pond-culture and the operations of the culturist.

Carps may reach a very advanced age, as specimens are to be found in Austria over one hundred and forty years old.

The increase in length only continues up to a certain age, but its circumference will increase up to its thirty-fifth year.

I have seen some common carp in the southern parts of Europe—in the lowlands of Hungary, Servia, Croatia, Wallachia, as also in Moldavia and the Buckowina—which weighed from 30 to 40 pounds and more, measuring nearly 3½ feet in length by 2¾ feet in circumference.

Old men, whose credibility and truthfulness could not be doubted, assured me and gave the most detailed accounts of the capture of this species of fish in former years, giants, which weighed from 50 to 60 pounds, and which they had seen themselves. During the Crimean war in 1853, a French engineer officer, stationed at Widdin, on the Danube, in Turkey, killed a carp by a bullet-shot, some distance below the city; this fish weighed 67 pounds. I had some of its scales in my possession, of which each had a diameter of 2½ inches. Their structure indicated to a certainty that the age of this fish could be no more than twenty-four years at the most. It is a well-known fact that two large carps, weighing from 42 to 55 pounds, were taken several years ago on one of the grand duke of Oldenburg's domains in Northern Germany. They had been kept in some particularly favorable water, productive of plentiful food, and had been used as breeding-fishes. These two specimens might, from their size, be calculated to be comparatively very aged fishes; it was proved that they were only fifteen years old. If we may credit the chronicles kept centuries ago by old families, and especially by the monks, who had taken possession of all the best localities along the banks of the beautiful blue Danube, then still greater giants had been caught, and that in the waters of the Danube itself. A chronicle of the monastery of Mölk, in Austria, refers to a carp weighing 78 pounds, which had been captured on Ascension Day in 1520. Another record speaks of a carp which had been taken in the third decennium of the present century in the lake of Zug, in Switzerland, and which weighed 90 pounds. These giants are certainly only wonderful exceptions, and have become celebrated through the scarcity of such occurrences, but still these facts are encouraging illustrations that it is possible for such large specimens to grow up in favorable water. All the countries, where these large fishes have been found and which are situated between the Black, the North, and the Baltic Seas, are pretty nearly such as have a late spring and a long, cold winter. Near Widdin the Danube has been frozen repeatedly. There the carp passes

from five to seven months in its winter sleep, during which it does not grow. If this fish thrives so well in the countries which have such a very cold winter (on an average they have the same winter-temperature as Boston, Chicago, Milwaukee, Pittsburgh, Philadelphia, New York, Baltimore, and Saint Louis), where the rivers have not enough food for these fishes by far, their level being regulated by dams, which are a subject of constant complaint to the fishermen, how much more would they thrive in the waters of this country with their great riches of food? But if we take into account the rivers of the mild south and southwest of the United States, what success may not be expected for this fish in those regions?

If the carp finds food in superfluity it will grow much more rapidly than the above statement indicates. This gives an increase of from 3 to 3¼ pounds in one year and six months; but this is only the normal one, the food consumed being of an average amount. If the fish obtain food very plentifully it will grow more rapidly. In this case, again, it is to be considered that the waters of the milder climates of this country possess this advantage, scarcely to be judged of or estimated at its proper value as yet, that the fish may be able, during three-quarters of the year or even the whole year round, to take food, and will omit the lethargic winter-sleep conditioned by the cold winter. There is scarcely a comparison to be made so far as the carp are concerned between the rivers of this country, so richly supplied with food, which it will not be compelled to seek for it under a constant strife for existence, and those of the much poorer waters of the Rhine, Elbe, Rhone, &c. In the waters of its native country, in Central Europe, after its first wakening from the long winter sleep, it seeks most diligently after the contents of the seeds of the *Nuphar luteum* and *Nymphea alba*, the yellow and white water-lily, the *Phellandrieum aquaticum*, *Festuca flaitans*, etc. The waters of the United States abound in all these plants and numerous others, the seeds of which will serve the fish as food; for instance, the wild rice, (*Zizania aquatica* and *Z. fluitans*,) the well known Tuscarora rice or "water-oats" with its great riches of seeds, and many others, which will yield food profusely and which European waters do not possess, thus giving a great advantage to the American carp-culturist. And then there is the culture of fish in ponds. There are culturists in Central Europe who, wishing to see the fish growing more rapidly, take the trouble to feed them with soaked barley, which they occasionally throw out in different places, and by doing so they have had a very full success, the fish growing larger, that is, more quickly, when not thus fed. By introducing the above-named wild or natural water-plants in carp-ponds they will be perpetuated, and the grains which have fallen to the bottom of the water will form an ample article of food for the first spring days, if we do not prefer to give them the almost worthless offal of the slaughter-houses. I do not advocate the so-called artificial feeding of this fish where the ponds themselves yield food in ample abund-

ance, a consummation toward which the Tuscarora rice will largely contribute.

Let us once more consider the fact of its extraordinary increase of weight of about 110 per centum in the exceedingly short space of four months, for during the cold winter-time, when ice thickly covers rivers and lakes, nature banishes it into its temporary tomb, which it chooses and digs for itself, to hold its winter-sleep in. This fish needs from fifteen to eighteen months of gro wth, to gain, according to a low estimation, the weight of 3 pounds without being fed. But much more satisfactory results are frequently arrived at when favorable circumstances combine and when it will reach a greater weight. There are some culturists who obtain in the same space of time fishes of 4 pounds weight; of course they possess warmly situated ponds, which thaw very early in spring, and perhaps they assist nature in some degree by feeding the fishes. I have done so myself in two successive years, which were exceptionally warm, when I fed the fishes with the almost worthless malt-refuse or "grains." They increased visibly and attained to the above-mentioned weight in the same space of time.

This fifteen to eighteen months of the actual time of growth transpires during a period of three years and six months, as intervening months of winter-sleep are to be included, during which the growth is interrupted.

I will not recur to what this fish promises to become in the milder regions of the south, where neither ice-bound water nor cold temperatures force upon it the lethargy of the winter-sleep, where it will have the longer space of from eight to ten months, or, may be, the whole year, including the mild winter, for the most vigorous and rapid development, not as in Europe, the sparingly allotted four or five months.

It is not to be doubted that the carp will arrive at the weight of from $2\frac{3}{4}$ to 4 pounds in one year in those warm climates, when in colder regions it requires two years and six months. I do not think that I am mistaken in this; I am ready to stand by this assertion, which the future will surely verify.

I believe I have said all that is most desirable for the culturist to know concerning the carp and its natural history, and I will now treat briefly of its culture in ponds, rivers, and lakes, as also the construction of ponds.

C—THE CULTURE OF CARP AND CONSTRUCTION OF PONDS.

1.—Its adaptability to artificial culture.

The conclusion from what has been said will be, that the carp is excellently qualified for culture in inclosed waters, as artificial ponds, and also for the stocking of open waters, such as rivers and lakes, for what is called "free fishing."

It is in the power of the culturist to produce, by means of artificial

impregnations and hatching, as also by the natural increase of this fish, with its abundance of eggs, any amount of fry, as well for fresh water as most probably also for salt water, as the fact of its occurring in the salt water of the Black, and very frequently in that of the Adriatic Sea, will demonstrate.

There is no other fish which will, with proper management, be as advantageous as the carp. Its frugality in regard to its food, its easy adaptability to all waters, in rivers, in lakes, and ponds, and even salt-water estuaries, its regular, rapid growth, and its value as a food-fish, are its best recommendations.

2.—The localities best adapted to a carp-pond.

I will try to describe, in the first place, the manner in which carp-culture in ponds is conducted in Central Europe, and subsequently explain more fully its introduction in open waters.

If intending to establish carp-ponds, it will be necessary to ascertain the following points before the execution of the plan:

1. Is there a sufficient quantity of water at hand for all purposes, for the summer as well as winter?

2. Is the ground, soil, and water favorable for culture?

3. It is important to examine the land minutely, in order to find what are the components of the soil, for not every kind of soil is suitable for carp-culture.

4. It ought to be decided from the commencement how large the establishment is intended to be, whether only for private use and pleasure, or whether wholesale production of the fish as an article of trade is contemplated.

If points 1 and 2 have been satisfactorially settled, then the ground must be examined, particularly whether it is so constituted as not to allow the collected water to penetrate, and whether the ground is sandy or loamy. Above all, it must not be neglected to measure the depth of the stratum which holds the water, and to be fully assured that it is sufficiently impermeable to withstand the pressure of the water and to hinder its oozing through, so as to prevent the consequent drying up of the pond.

A rocky, gravelly ground is not appropriate for carp-culture. Sandy ground, without a considerable mixture of loam, clay, and humus, is of small use. I speak here of large ponds of considerable extent. Small ponds with a sandy bottom may be improved by supplying them with loam, as it is frequently done in agriculture.

Loam is a mixture of a small per centum of sand and a larger quantity of clay, and is suitable for ponds. If such ground contains some marl, or, better, some little elements of humus, it is of the greatest advantage for fish-culture. These constituents of humus, if dissolved, give the water a yellow, muddy color; and this water supports by its ingredients a profuse number of microscopic beings, which again form the support

of a larger class of creatures, and represent therefore the productiveness of food of the pond, on which, in its turn, the carp depends for its sustenance. Too much humus or dissolved peat is injurious. Water which runs through bog-meadows or oak woods is not of much use, because it contains too much humic acid and tannin; these impart a moldy taste to the fish. A too considerable amount of gypsiferous earth, carbonate of lime, or sulphate of lime is injurious also. Should any mineral-springs fall into a pond they must be turned off. The most favorable water will always be that which comes from rivers and brooks. Ponds might be constructed which would fill themselves with rain-water during the winter or at any other time, but such water takes a moldy taste easily, which it will communicate to the fishes, as does the water from bogs also.

In Europe, experience has shown that water coming from fertile fields and meadows, carrying with it particles of offal from villages, is best adapted for carp-culture.

Spring-water direct from the ground is not favorable, and ought to be conducted for at least a few hundred yards through wide, shallow ditches, in order to receive more nourishing components from the air as well as the earth, and above all to be warmed to some extent by the sun and warm air.

A tract of land, such as above described, merits the preference as a site for a pond, if in other particulars the ground is favorable and has not too great a fall. If this were the case, very high and strong dams would be required for the collection of water. Such dams cost large sums if constructed of good water-proof material.

A low undulating country, with only slight elevations or hills, where the small valleys are easily closed up by dams for the purpose of forming reservoirs, is favorable, the construction of these dams involving comparatively trifling expense.

3.—The construction of the ponds.

Ponds must not be too deep, as the water will be colder and will harbor fewer insects, larvæ, and worms, which form part of the carp's food; besides, this fish does not grow quickly in cold water. A depth of 3 feet in the center of the pond is sufficient; toward the outlet-sluice it may be from 6 to 8 feet deep, but only for an area of from 200—1,000 square feet. In the depths of this "collector" the fishes seek their resting-place for the winter, and also in summer, when the water is too warm near the edge. The outer part of the pond should not be deeper than one foot for the distance of about 70 or 100 feet, so that the water there may be warmed more thoroughly by the sun.

Toward the center of the pond, and in accordance with its size, a cavity of from 20 to 50 feet in length and 2 feet deeper than the rest of the ground should be dug. This will serve the fishes for a resting-place

in summer and winter. This cavity is sometimes called a "kettle," though the appellation varies in different localities.

From the entrance of the pond to the other end, where the "collector" and the outlet sluice are situated, two or three ditches of 2 feet in depth and 4 feet in length must be made, which cut the deeper "kettles" transversely as far as the collector. These ditches are intended to carry all the fishes into the collector when the pond is being drained. The collector is nothing but a place of from 20 to 40 feet in length and breadth near the outlet-sluice, 1 foot deeper than the remaining bottom of the pond. In ponds of superior construction it has generally a wood flooring, and must be cleaned of the mud every year, so that the fishes may not become too much soiled by the mud.

In speaking of the erection of a breeding-establishment for carp I have in view a water extent of at least 35 to 70 acres area, which in Central Europe would be considered an establishment of about one-third magnitude.

The inflow of water into the pond should never be allowed to be direct; as, for instance, a brook falling into it. This often causes the water to rise at an inopportune time, carrying into the pond other fishes, especially the rapacious pike. The carp also has the disposition to swim toward the inflowing water, by which means it is drawn away from its proper feeding-places. The water should be conducted into the pond sideways from the stream; and if it should be a small brook only, it may be turned off entirely and carried alongside the pond, from which point the latter can be easily supplied with water.

The inlet-sluices from the stream must of course be of a strong and practical construction, so that an overflow is impossible, and they ought to be provided with gratings to prevent other fishes from intruding.

It is an indispensable condition for the culture in ponds, according to established rules, that they be so constructed as to allow of being thoroughly drained, so that the fishes may be taken out without any difficulty. The bottom of ponds should be of such a description as to permit their being dried up for agricultural purposes if necessary.

In Europe ponds of from 10 to 2,000 acres extent are frequently to be found, which, after having been used for fish-culture for a time, are dried up, and sometimes grass, oats, wheat, &c., are planted on the ground. This improves the soil exceedingly for fish-culture. I mention this simply in order to show that the soil gains by this manipulation not only for fish-culture but also for agriculture. If the soil at the bottom of ponds has been freed from the humic acid by vegetation, after being plowed and exposed to the air thoroughly, fishes will thrive incredibly well in them. This I intend as a suggestion particularly for farmers, who would wish to establish a small pond of perhaps 5 or 6 acres size, to show that the soil of their land would not lose, but rather gain by doing so. Agriculture and carp-culture go hand in hand in some Central European countries and form a kind of complement to one an-

other. To-day a piece of ground may be a field or fertile meadow; next year it will be found to be a productive pond, to serve again one or two years later its first purpose.

If the size of the principal and supplementary ponds has been decided on, the height, depth, and width must be measured, and the levels of the ground and dams, if such are needed, should be carefully taken. The leveling of the bottom is required to assist in the determination of the depth of the ditches, "kettles," collector, and outlet to be dug in it.

In the erection of the required dam it is most important that it be constructed of the very best material, so as to make it secure against the destructive influence of the water. It ought to be three times as wide at its base as it is high, and at the top the width should be the same as the height. The interior or water side should be less inclined than the exterior one.

Before the foundation of the dam is laid, the ground where it is to stand must be dug out to a depth of 2 and a width of from 4 to 5 feet throughout the whole length of it. If the ground does not consist of loam it must be filled up with it about 1 foot deep, and this must be tamped down hard. A second layer follows and is disposed of in the same manner. This is repeated, the clay being moistened every time if required, and then beaten down solidly. This lower stratum is but the foundation of the dam, which is formed from the earth dug out of the pond or its vicinity. This is continued until the dam is completed. Care must be taken, however, that the construction and tamping down of this lower stratum be done in layers and that nothing but good clay be used. In this manner the material of the foundation will become a very tenacious mass, which will not allow any water to penetrate. The completion of this laborious task will be a source of ultimate satisfaction, as many disadvantages, which might arise after the filling of the pond, will be done away with through its agency. The dam should not be made entirely of clay, for in mid-summer, during the great heat, it would dry out too much on that side most exposed to the sun, and consequently it would become full of fissures, through which the water would escape, and this might become disastrous for the establishment.

On account of the required outlet-sluices, etc., the fact must be kept in view, that such newly constructed dams will sink 10 per cent. after a lapse of time of little more than a year, with the exception of that portion which has been solidly made. The dam should be sodded. For the draining of the pond, at the "fishing out" season, it should have an outlet at the lower end, if no other advantageous arrangements can be made for the purpose. The use of wood-work for the channel should be avoided, its durability not being sufficient. The most desirable construction would be that the outlet channel consist either of masonry-work or water-pipes, which may be made either of clay or iron. This channel or pipe must be so made that it can be closed tightly or opened

again readily if needed, and must be provided with two or three-fold gratings to prevent the escape of the fishes upon the opening of the sluice. At the same time there should be an outlet-channel, several feet in breadth, at the side of the pond, to allow the water to run off. This must also be secured by grating, but should be kept open always, so that in case of continued rainy weather or sudden and violent showers of rain or thunder-storms no overflowing of the banks or dams may be possible through the unexpected rising of the water in the pond. Large fish-ponds of several hundred acres extent (some have a surface of 1,200, 1,500, or 2,000 acres) have generally and according to their size two or three outlets I have described, and which pass underneath the dam. The outflow from these is usually regulated by adjustment of the flood-gates from the top of the dam.

The so-called "Mönche" (monks) are wooden boxes, which stand in the pond at a distance of a few feet from the dam. They are perforated like a sieve, or are provided with small adjustable boards, and wooden pipes run from them through the dam. In Bohemia they are called "carp-houses." They are, however, rarely used in large establishments at present, only such culturists making use of them who have but small breeding-ponds at their command and carry on culture on a small scale. These locks suffer too much from the water, air and sun, as also from the pressure of the ice in winter, so that they require considerable repairs at an early date after their first coming into use; but they serve their purpose fully in small ponds, especially in smaller ponds, which are intended for pleasure or experiment.

There are so many different ways of constructing these subterranean sewers, that I may as well pass them over; they belong more particularly to the department of hydraulics. It is the province of the culturist to find for himself that which will be the best and most practical method in the construction of outlets.

If it be desired to make use of natural ponds, of which there are numbers in every State of the Union, it is necessary to ascertain whether they can be put into the proper condition for regular culture. This can only be done if the influx of water can be regulated and the entire drainage of the pond made possible. An intrenchment will be required with such ponds in order to make them dry. Trunks of trees should be taken out of them; and where they are too deep they should be filled up, or, if this cannot be done, they should be brought into connection with the above-described sewers on the bottom of the pond. If this is not done too many fishes will remain embedded in the mud when the pond is being drained, and this lessens the profits to a great extent.

Should any brooks fall into such ponds, as is often the case with large ones, they must be kept under strict observation on account of possible overflows which might occur. If it be practicable the brook had best be turned off and conducted alongside the pond, when the latter can be supplied with water if required.

Such brooks, coming from a neighboring hilly territory or from mountains, will frequently occasion an overflow if either a thunder-shower or sudden thawing of snow and ice should set in; in the latter case the ground might be too hard with the frost to allow the water to run off readily.

If the overflow should even be inconsiderable it would still exercise an injurious influence upon the fishes, as the influx of so much water, which in all probability would contain unfavorable substances, would be apt to drive them from their winter retreat.

In summer, sudden, violent rain-showers may cause an overflow within a few minutes, which will carry off the fishes, and eventually may destroy all the ponds. To secure against this, the construction of reserve-sluices, such as are contrived in artificial ponds, and a wide reserve-ditch alongside the pond, which is destined to carry off the threatening high water, are recommended. A small dam between the pond and brook, instead of the reserve-ditch, will sometimes answer.

Great caution is necessary in the selection of the site for a pond or the natural pond, which is to be converted into a carp-pond.

Overflows not only injure the ponds and fishes, but may result in a still worse disaster, that of carrying away the fishes into strange waters and destroying the ponds.

The fundamental rule in carp-culture is that the water be of the same depth in summer and winter. If the supply of water is too plentiful, great quantities of mud are carried into the pond, embedding the grass which grows in it and on its banks; this, in consequence, will rot and poison the water. The carp immediately desert such water on account of its offensive odor and retire from their proper feeding-places to depths deficient in the production of food.

The mud, which is being constantly reproduced, consists of the remainders of plants. From these different gaseous compounds develop themselves in midsummer, and the fishes become sickly in consequence. In this case, especially if they rise to the surface seeking for air, more water must be supplied through the inlet-sluice, when they will recover by degrees. A casualty of this description may occur in very large ponds, though no overflow may have taken place.

Pernicious gases develop themselves from the mud even in winter, but they rarely have any bad effects, being injurious only if the water is covered by ice, when the fishes die from suffocation. For this reason large apertures are cut into the ice for the supply of fresh air.

4.—Stocking the ponds and care of the fishes.

To carry on carp-culture in a regular and judicious manner, several ponds are required, according to the various purposes they are destined for.

1. The hatching-pond.
2. The breeding-pond.
3. The culture or regular carp-pond.

The hatching-pond serves more particularly for natural impregnation and hatching, or rather for natural propagation generally, by placing a number of male and female fishes into the pond. Here the females drop the eggs, during the spawning season, upon aquatic plants, where they are impregnated by the male.

In stocking ponds, three females are calculated to two males, sometimes twice that number, per acre. The females bear a great number of eggs, as has been remarked before, but the smaller number only are impregnated, neither do all these come to life.

The most liberal estimate will not exceed the number of from 800 to 1,000 young fishes to one spawner; the aggregate per acre amounting to from 4,000 to 5,000.

It is scarcely possible to say what is the most desirable number of milters and spawners for stocking ponds, as the views on this subject differ widely in Europe. I believe, however, the above to be correct, and it is accepted as such by all extensive establishments.

The above-mentioned result will be much more favorable if the old rule, now unfortunately almost forgotten, is observed, to feed the carp which are in the spawning-pond, shortly before and during the season of spawning, so as to prevent their searching for food, which generally leads them to eat their own eggs. After the fish have laid their eggs, they must simply be removed from the ponds, which prevents their eating the eggs. This useful rule, formerly much practiced in Europe, has unfortunately fallen into disuse; in fact, it has almost been forgotten, probably because carp naturally increase very fast.* By removing the spawners, three times as many young fish are kept alive than by leaving them in the spawning-ponds. On no account should too great a quantity of young fish be placed in a pond. The

* In Germany, this rule is only observed by some small pisciculturists; in France, on some of the former lordly manors—in the department of the "Seine inférieure" and in the department of the "Rhône"—where they likewise had the custom to plant aquatic plants (*Utricularia*, *Phellandrium*, &c.) in loosely-plaited baskets, which, when covered with the impregnated eggs, were transferred to other ponds. Duhamel also practiced this in his time. This practice has doubtless led Dr. Lamy, of Rouen, to his artificial spawning-places made of reeds. By an order of the abbot of the Benedictine Convent of Kremsmünster, in Upper Austria, (founded in 777,) of the year 1529, the fishers of the convent domain were reminded that spawning-carps must be of a certain age and size, and must consequently be weighed. After spawning, they had to be removed from the pond. This convent is still in existence, and is the wealthiest convent of the Austrian monarchy, owning upwards of 150 large villages and possessing a large and valuable library and observatory and scientific collections. But the order of the good old abbot is no longer observed. Similar orders were, in former centuries, also given by other convents in Austria, as Lambach, in Upper Austria, Wellehrad, in Moravia, and others. The fishermen's guilds of Nuremberg and Bamberg had, about the year 1600, similar rules, which were placarded in their guildhalls, and which were strictly observed. At present such rules are not known in either place.

above-mentioned number of 4,000 to 5,000 young fish to the acre requires water which is very rich in natural food. If there are too many young fish in the spawning-pond they grow very slowly, as the pond cannot produce the necessary quantity of food. Such fish are scarcely one to two inches long when they are one to two years old; only the head grows a little, whilst the rest of the body remains small. As soon as young fish feel the want of food for any length of time, the gristle and bone of the skeleton harden, thus bringing its development to a close, not allowing nature fair play, and the fish remains a cripple for the rest of its life, even if it is placed in ponds affording unlimited supply of food. It is therefore better either to place fewer young fish in the ponds or to make the ponds larger; it will be found to pay. The young fish will grow rapidly; their development will be healthy, and even during the first year they will reach the length of five to six inches. Strong and healthy fish can thus be placed in the growing-ponds, and here, too, they will grow rapidly. If there are too many young fish for the water-area, it is better to place them in some lake, brook, or river. On no account should they be kept in the pond. Beginners in carp-culture usually consider it quite a sacrifice to let so many young fish loose in the open river or lake; they keep them, and later they will bitterly regret their parsimony, or rather their imprudence, by having weak or not fully developed fish.

The hatching-pond should not be as large as the breeding-pond; its depth not to exceed 1′ or 1½′ foot. The outer portion, or, as it is termed, the low-water margin, should generally be from 2 to 5 inches in depth, and from 30 to 40 feet in width. Provision should be made that *Festuca fluitans* grows there plentifully; for the fishes give the preference to this plant for the deposition of eggs, as I before observed. But the bottom of these hatching-ponds must be of similar construction to that of the larger ones; that is, they must be provided with the above described cavities, or kettles, collectors and collector ditches. The "collectors" must be cleaned from the mud every spring; they need not be as deep in these ponds as they are in such as are intended for the reception of larger fishes; a depth of from 4 to 5 inches only being required for fishes of minor size. The hatching-ponds have outlets and reserve-sluices in the dam, at the lower end or on the sides, to guard against overflows. These ponds must be secured against the intrusion of pike, eels, bass, catfish, tritons, water-snakes, turtles and water-lizards, rats and water-fowls, or any voracious animals, and in the south the alligator. A fine grating will prevent the entrance of the former; against the latter various traps are in use, and other means might be devised. It is of the highest importance that new ponds be assiduously kept clear of the animals mentioned, and of many others not named here.

In small establishments, embracing only a few acres, it will be found advantageous, in spite of the somewhat greater expense, if the ponds (both natural and artificial), either all or singly, are surrounded by a

very close board fence, 3 to 4 feet high, and going 4 to 6 inches into the ground. Such a fence will afford no protection against aquatic birds, water-snakes, and muskrats, but it will exclude the snapping-turtle, the most dangerous and voracious enemy of fish, which is more to be feared than either cranes or otters. This detestable animal has been known to clean a pond of fish, and then, led by its sense of smell, to follow the fish, going even up hill and against the stream. At night it seizes the fish, which, not suspecting any danger, rest at the bottom, with its sharp fangs, resembling shears, and kills them. It is a peculiarity of carp to keep at the bottom during the night, and likewise during cold and gloomy weather, and the snapping-turtle would therefore have many an opportunity of destroying them. Large iron fish-hooks, with a piece of meat fastened to them as bait, will do good service, if distributed in suitable places on the banks. This should be done from spring to October. The pieces of meat should be of such a size that even large carps cannot bite them; they will then form a most attractive bait for the ugly monsters. These hooks should be fastened with a strong brass wire, as the snapping-turtle could easily bite through twine, and should be inspected every day.

In placing spawners in ponds, great caution must be practiced in their selection, so that only really healthy fishes may be introduced, and not such as are affected by fungous growths, the gelatinous polyp, or other disease. In Europe the polyp, in particular, has frequently destroyed the productiveness of ponds for many years.

The newly-obtained young fry are left in the hatching-ponds during the winter, after which they are to be transferred to the larger ponds.

The catching of the young fishes must be done with great care, and the water must be drained off through the grated outlets very slowly, so that no fishes may remain in the mud, for if a new hatching operation is contemplated in the pond, the newly hatched fishes will be retarded in their growth on account of the scarcity of food, this being consumed by any remaining larger ones. The young fishes must be handled carefully, for the slightest injury of the scales may cause disease and death.

The breeding-ponds have the same construction as the hatching-ponds; they have dams, reserve-sluices, outlet-channels, collectors, and ditches in the bottom. The only difference is in being deeper and larger than hatching-ponds. They have an average depth of 1 foot 9 inches, and the width of their shallow borders is from 70 to 80 feet. The "kettles" have a depth of 4½ feet from the surface; their borders are from 6 to 8 inches deep. The growth of grass should also be advanced in these ponds. In small ones of about 4 or 6 acres, the "kettles" may have a length and width of 60 or 70 feet.

The stocking of the breeding-ponds takes place in spring, immediately after the emptying out of the hatching-ponds; it lasts from the latter part of March until April.

From 800 to 1,000 breeding-fishes may be calculated to an American

acre, 800 being the average. To cover possible risks, 100 more may be added, as in the most successful pond slight losses are to be expected.

In favorable ponds, where the carp is left to seek its food, it will have gained a weight of about 1¼ pounds in the ensuing autumn. In small ponds, about one acre in size, where feeding is practiced, they will weigh more.

In the southern countries of Europe, in favorably situated ponds, they will sometimes reach a weight of 2 pounds in the same space of time. This I found to be the case in southern France; however, these favorable results are only attributable to the mildness of the climate, and I doubt not that proportionably better results may be arrived at in the south of this country.

In ponds of small capacity, in which nourishing food is produced in small quantities, the results of breeding are not very encouraging.

An advantage will be gained in northern, colder countries, by leaving the young fishes two summers in the breeding-ponds; that is, they are transferred to a second, larger one, and only from this they pass into the culture or real carp-ponds. This will answer especially well if the bottom of the pond is poor, or if feeding has not the desired effect.

This method is followed by many competent culturists in Germany and Austria, who, in the possession of extensive lands and excellent, numerous ponds, find it to their advantage, as it enables them to place larger breeding-fishes in the carp-ponds, and though this is done a whole year later, the loss of time is compensated for by the large size of the fishes produced in the carp-ponds.

In the spring of the third year those fishes which have been one year in the breeding-pond are transferred to the carp-ponds, the construction of which I have described before. Fishes having been kept in the breeding-pond for one summer only, without being fed, will be found to weigh at the expiration of that time from 1 to 1¼ pounds, while those which remained there two summers will show a proportionally greater increase of weight. In Southern Hungary and Croatia the fishes kept in the breeding-ponds but one summer occasionally thrive more favorably. Differences in the ratio of weight are commonly owing, as I observed before, to climatic influence, and the greatest and most rapid increase will be found in localities where there is an early spring and where the months of September and October are warm, but particularly where the nights are still and mild during spring and autumn.

Breeding-ponds should have a certain number of fishes only placed in them when they are stocked, and that number should never be exceeded. For the culturist it is important to bear in mind that the younger the transferable breeding-fishes are, the less expense they will have caused and the sooner their money-value may be realized, all carps weighing 2½ pounds and more being for the market.

To stock a culture-pond of one acre 400 to 500 carp, of one pound in weight, will be required, and in the following year, or rather in the

autumn of the same year, when the fishes are taken out for the market, they will weigh in a good pond 2¾ to 3 pounds each, or about 1,200 to 2,000 pounds in the aggregate. In some localities only 200 carp are taken to one acre of American square measure; in other places more.

Pike* are frequently put into carp-ponds in Europe without reducing the number of the carp, one pike being added to 25 or 30 of the former. This is an old practice, which has been proved of great use by experience, assisting through the effects exercised in the improvement of culture—that is, the favorable progress of the fishes. The carp is a very indolent fish, which frequently remains for many hours in the same place at the most favorable period for feeding, namely in summer. It is aware of the pike's voracity and remains always cautiously at a distance from it. The introduction of the pike is practiced for two reasons: (1.) That the carp may not constantly remain in the same feeding-place, but, frightened away by the pike, may visit others also; (2) it is done, and principally so, to prevent the more mature carp from spawning; should the spawning occur, as is the case occasionally, the young fry will be devoured by the pikes, which otherwise would have deprived the large carps of their food. The pike will also destroy those fishes and their spawn which had succeeded in getting into the ponds without the knowledge or through the inability of the culturist to prevent it. Great care is required in the introduction of the pike; specimens of minor sizes than that of the carp must be selected. The growth of the pike being much more rapid than that of the carp (300 per cent. per annum), the former should be younger by one year at least than the latter, so that it may not prove dangerous to the carp. If this precaution is taken in the introduction of the pike, it will be an actual boon to the carp-colonies, for it will not only exterminate by degrees all those parasitical fishes which intrude themselves into the ponds, but it will devour frogs or the smaller kinds of its own species as well as water-snakes and tritons.

Should the pike suffer from want of food after having cleared the pond of all these animals it must be supplied with it; small spoiled fishes, or such as have been stunted in their growth, will answer the purpose. If this is neglected the hungry pike will attack its companions, the carp, and though it may not devour them, it will mortally wound them with its teeth.

I have so far given the principal traits of natural carp-culture, and will speak more explicitly of the artificial impregnation and hatching of the carp's eggs in my next report. So far as I know, this latter method has been little, if at all, employed in Europe, although it offers much greater advantages for the production of vast quantities of spawn. My own experiments were rewarded by the best results. I intend continuing them this summer in Baltimore, and hope to communicate the results hereafter.

*Males are selected for this purpose.

I now proceed to give a few rules of general importance for the construction and management of carp-ponds.

The ponds should have as shallow a border as possible. Their depth should be in accordance with their size, one foot in the culture or regular carp-ponds where large fishes are kept; ½ foot in breeding and ¼ to ½ foot in hatching ponds. The borders should be of considerable width; it is desirable in any case that a great number of such shallows be contrived in ponds, as these are the principal feeding-places of the carp.

Another important condition to be considered is this, that the water in ponds must be of the same depth all the year round, any variation in this having an injurious influence upon the fishes.

Ponds of smaller circumference, of from 10 to 15 acres, are, according to results obtained, better suited for carp-culture than very large ones, 100 to 1,000 acres in extent. These are frequently found in Central Europe upon tracts of land belonging to some princely domain. In the former the fish finds more security, the bottom of the pond being smoother; it also suffers less from the waves, these being high and rough in large ponds, becoming very detrimental to the spawn and breeding-fishes, especially during storms, when they are cast ashore and become the prey of water-fowls or perish in some other manner.

The diminution of water by evaporation must be made up for by a fresh supply; this, however, must not exceed the quantity actually needed for maintenance of the regular height of water. Small ponds of from one to fifty acres area, which serve some commercial or industrial purpose, as mills, &c., and which are constantly varying the height of their water, cannot be considered as favorable or regular culture-ponds. Although the fishes may grow to a pretty good size in them, they must still be regarded as belonging to the category of waters for "free fishing," like lakes and rivers. In these neither the height of water, nor the hatching of the eggs, nor yet the increase of aquatic animals, can be regulated at will. Still, leaving these waters to lie waste on this account would be a pity, for if stocked with carp they will, in spite of all disadvantages, remunerate the proprietor, and the care which he bestows on them will be a source of much pleasure.

I beg to make some remarks, in conclusion, relative to the introduction of the carp and its increase in open waters, in which it is solely left to the care of nature, and to which subject I alluded at the commencement.

We introduce into our waters migrating fishes, such as the salmon and shad, and find it profitable, for the reason that they consume but little food in the rivers, growing up in the sea and ascending into fresh water as large fishes. We also maintain in our lakes white-fish, bass, pike, &c. These are all fond of animal food and belong in part to the class of fishes of prey. The carp, on the contrary, lives upon vegetable food, insects, larvæ, and worms, but it never attacks other fishes or

their spawn. It can be produced in masses and then be transferred into the waters destined for its reception. This can be done either by artificial impregnation and hatching, or in the way of natural increase.

For each of these methods two ways of action are open: (1,) the spawn can be transferred into open water as soon as it is free from the egg; or, (2,) the young fishes may be kept in ponds for a season until they have had time to grow—that is, for one summer. In the latter case, the rule, that fishes which are destined for open waters must not be artificially fed, is to be strictly adhered to. Carp which have been used to feeding in that manner will not be so apt to find the food for themselves which, until then, had been supplied to them. Tormented by hunger, they will lose the fear of their enemies and the consequent cautiousness, falling an easy prey to them before many weeks will have elapsed.

If artificial feeding is not intended, the ponds for the reception of the small fishes must be proportionately larger, so that they may find food in sufficient quantities in a natural way. Both methods have their advantages. If the young fry is transferred into open water five or six days after hatching there will be no necessity for the establishing of large ponds. A great number of eggs must, however, be hatched in this case, for the small fishes will be destroyed in vast numbers by their enemies.

The better method of the two is certainly this: to keep the young fishes in large ponds until the fall, when they will have reached the age of five or six months. During this time they will have had the opportunity to learn how to find their food by their own efforts, such ponds producing it profusely to satisfy all their wants, and thus they will be prepared for their stay in open waters. To carry through the latter method, a larger extent of water is required, nature itself having indicated precisely the conditions under which and the limits in which the natural and unimpaired growth of the young fishes may be expected.

They do not require as extensive a pond during the first months of their development and growth as those which have reached a more advanced age. For this reason it will be more advantageous to choose the middle way by retaining the young fishes in the ponds for about one or two months and then to give them their liberty instead of transferring them immediately after the hatching or keeping them for five or six months. By acting upon this suggestion, the incalculable advantage will be gained that the fishes profit by the rich food of the open waters during the season and will have grown strong enough to fight more successfully for their existence. For this purpose, establishments for artificial breeding, constructed with a regard to the demands of climate, are essentially needful in these open waters, so that the greatest possible number of eggs may be hatched.

In Europe the subject of stocking open waters with carp has been discussed, because there, in its native country, its excellent adaptation for this purpose has been recognized.

I observed above that this fish is found in great numbers in most of the European rivers, particularly in the Rhine. Although this river has a very swift current, which at times forms rapids, here neither mud nor suitable ground is to be found which would qualify these localities for feeding-places for the rather indolent carp; still, there are numbers of shallows and small creeks, the borders of which are richly overgrown with grass and *Festuca fluitans*, where the fishes find food plentiful and multiply.

The river-carp is not as fleshy as the pond-carp; this is accounted for by the great amount of bodily exercise which it is naturally compelled to take. In many places it is more highly appreciated than the pond-carp, probably because the river-water does not impart to it the moldy taste which is sometimes found with the carp inhabiting ponds situated in marshy localities and morasses which have not a sufficient supply of fresh water.

The assertion in regard to the preference given to the river-carp will be found to be correct, especially in regard to the rivers Rhine, Elbe, Weser, Vistula, Loire, Rhone, Garonne, and the Danube. The latter is celebrated in song as the beautiful, blue Danube; in reality its water has, during the greater part of the year, a grayish-white, muddy color, and a very swift current. It has, however, particularly in Austria, Hungary, and the lowlands in general, which border upon it, numerous branches which creep along sluggishly, and also many small creeks with almost stagnant water.

A great number of fishes of prey inhabit this river: the pike, perch, the rapacious Hucho (*Salmo hucho*), and, above all, the never-satisfied *Wels* (*Silurus glanis*), which, in the lower Danube, reaches a weight of 500 pounds. Its habits being similar to those of the carp it lies on the mud-banks or feeding-places of this fish and becomes its most dangerous enemy and insatiable destroyer, and still the carp increases in the Danube. From the city of Ulm, where this river begins to be navigable, after its escape from the Black Forest, a thousand miles downward to its mouth on the Black Sea, as also in this one, the carp is found. To this fact allusion has been made on a former occasion. The carp thrives best in those parts of the Danube where the water is least clear, at the influx of the muddy water of its tributaries. At one time I was present at a draught of a seine which took place close to the quay of the city of Pesth, in Hungary, and was arranged by Mr. Szihelsky Ferentz. At that point the river is constantly plowed by steamers, steam-tugs, canal and ferry boats, and it would have seemed that there could not be many fishes there, yet 300 fine carp, weighing from 1 to 5 pounds each, were taken in one draught of the net, within the distance of about one-quarter of an English mile. The carp is partial to this locality because it finds abundant food there in the offal from kitchens, slaughter-houses, breweries, and the sewers of both the cities of Ofen and Pesth. In the European lakes, for instance in the lakes of Constance, Zurich, and Geneva, the carp comes sometimes from these into the ports to seek for food.

Comparing the water of the Danube with that of the Mississippi, I feel convinced that I may safely assert that the carp would thrive excellently in the latter, although its water appears to be even more muddy and rapid than that of the Danube, and I believe this to be true of the Missouri and Ohio and many others of its tributaries. The Mississippi has near its borders many spots where the current is slow and which are partially covered with vegetation; there are also numerous creeks, where the fishes would find food plentifully in the alluvial mud on the banks. What has been said of Mississippi will be found to be the case with many other, or probably nearly all, American rivers. They will be found to be adapted for the introduction of the carp, so long as they are not mountain torrents which have to break their way through rocky and pebbly ground. The increase of this fish is of great importance from an economical point of view, especially so in regard to the southwestern waters.

Under the present circumstances it is to be hoped that the endeavors which have been made for this purpose may before long be rewarded by success, and become a *fait accompli*, and that the difficulties which will have to be overcome may not prevent the achievement of it. The effort will and must meet with success at last.

5.—TAKING THE FISH FROM THE PONDS.

The emptying out of ponds demands the greatest caution and attention. The water must be made to flow off very gradually through the several outlets, all of which are to be kept open at the same time; it requires frequently from ten to eighteen days to draw off the water. The fishes are driven carefully and slowly with boats into the principal ditches. They must not be chased on any account, or they will bury themselves in the mud; occasionally many thousands will do so within a few moments, and will remain there, pressed together closely, and so perish through suffocation. This is recorded as having occurred from time to time, when during the process of driving them into the ditches the fishes were startled by some unknown cause and all sank into the mud instantaneously. Through the impossibility of extricating them speedily enough, many hundreds and even thousands perished, the owner sustaining heavy losses in consequence. To guard against such an emergency, preparations should be made for an immediate supply of water in similar cases, in order to save the fishes. If the fishing-out progresses in the regular manner, the fishes will by degrees draw off from the ditches into the collector. The collecting takes from five to six days in large ponds, containing frequently 100-400 tons of fishes. Care should be taken, that crowding them together may be avoided. On the evening before the fishing-out, when the water of the pond has been diminished to the depth of half a foot, those fishes which have been collected are shut off from the pond by a large net, and in the early morning, at the dawn of day, they are caught. As so large a number

of fishes cannot be disposed of at once, they are transferred to the so-called market-ponds, from which they are sold by degrees to fish-dealers. These market-ponds are quite small, capable of holding from 2,000 to 3,000 pounds of fish only, and are supplied with running water.

Those who never saw the fishing-out of a carp pond can scarcely imagine the beautiful sight of so many thousand fine fishes, fat and well fed, raising their high, broad backs and thick, puffy lips above the water, their heads side by side, all being nearly of the same size, weighing from four to five pounds, their bodies closely pressing against each other, looking like an immense herd of sheep, imprisoned in one large net upon a circumference of 3,000 to 4,000 feet. Closer and closer the circle is drawn around them, until its extent measures only about two acres, when they are caught by thousands, weighed in lots of 100 pounds, and then they are placed into the market-ponds. The pikes, which have reached an almost equal weight, are put into pike-ponds. It requires often two or three days to weigh the fishes, ponds of 1,000 or 2,000 acres area containing on an average 200 tons of carp and 20 tons of pike; tench and other fishes not included.

I assisted once at the fishing-out of one of these ponds, which took place in the neighborhood of the town of Guben Pleitz, province of Brandenburg, Germany. The pond was the property of a competent culturist and valued friend, Mr. Thomas Berger, of Georgenhof, near Cottbus-Peitz. The ponds in which this gentleman carries on carp-culture exceed the extent of 6,000 Prussian acres. The pond which was fished out at the time I speak of was but a small one, not more than 200 acres in size, yet to my surprise I found that the greater number of the fishes were fine specimens of about 3 pounds weight, though they were but in their second year, having weighed no more than $1\frac{1}{4}$ pounds five short months before, (the fishing-out took place at the beginning of October,) and they had attained to this great weight in a comparatively very limited space of time. Several establishments of this kind are located in that district, and they commonly belong to some large princely domain, (crown property.) They are, like all large fisheries, admirably managed, and the results are most satisfactory.

6.—MIXED CARP-CULTURE.

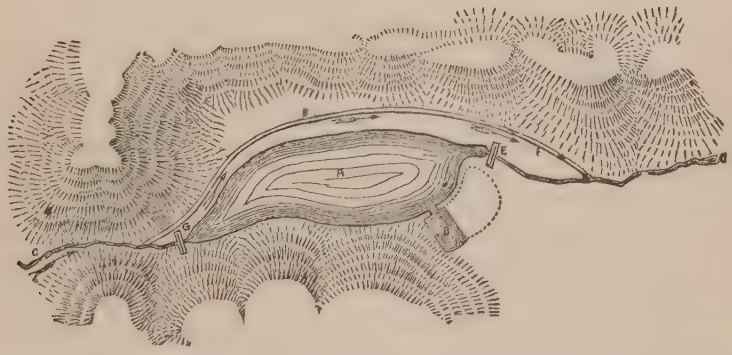
We have so far spoken of carp-culture, according to the different age of these fish, in special ponds (hatching, breeding, and carp ponds), termed "class-culture" in Central Europe. We must now speak of another method, pursued in so-called "mixed ponds," in which there are fish of all ages, from 1 year to 8 to 10 years.

Not much can be said regarding this method, as there are no hatching- and breeding-ponds, but only one pond, which, however, must combine all the characteristics of the class-ponds. It must therefore have shallow places, overgrown with grass or aquatic plants (*Festuca fluitans* and *Phellandrium*), for the spawners and the young fish, and also places, 8 to

10 feet deep, for the larger fish. If such a pond is to yield some profit, it must also be particularly rich in food. A natural pond may be used, or, if such a one is not found, it may be artificially constructed. It is indispensable, however, that such a pond should have the same depth of water all the year round, and it should be so arranged that even the last drop of water can be let off, as occasionally even the smallest fish, measuring only 2 to 3 inches in length, must be taken out. Such "mixed ponds" must likewise have "collectors" and "collector-ditches." It will also be found very useful to construct a sort of hatching-place, on some flat and sunny place, near the bank, *i. e.*, a so-called cut in the bank, measuring 40 to 100 feet in length and 30 to 50 feet in breadth, and having a depth of 5 inches to 1½ feet. This cut should be thickly planted with the above-mentioned aquatic plants, and ought, so to speak, to be the only place in the pond where carp can ascend from the depth in order to deposit their eggs conveniently and engage in the spawning process.

As soon as this has taken place, the entrance to this cut is closed with a net, so the eggs cannot be eaten by the fish. This net may be removed when the young fish have come out of the eggs, but it is preferable to leave it in its place for some days, that the young fish may be able to feed for some time undisturbedly.

Fig. 1.



Explanation of diagram.—A is the pond, B the cut, which, though directly connected with the pond, is in reality nothing but a hatching-pond, such as has been described above. In order to have a complete system of ponds, nothing would be required but a "breeding-pond."

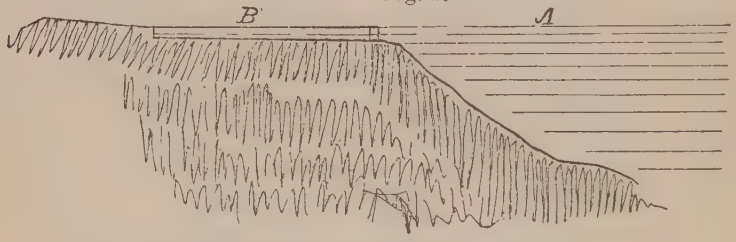
In Europe this method was generally adopted by beginners in carp-culture, commencing with a mixed pond, and gradually proceeding to the small "hatching-pond," and finally to the "breeding-pond," as the great advantage of separate ponds for the different ages of fish over the "mixed-pond" system soon became evident.

In such a "mixed pond" no pike must be kept for regulating the stock, as may be done in a class-pond, for all the small fish would then soon be devoured. It must be made a strict rule that, with the excep-

tion of the tench (*Cyprinus tinca*), no other kind of fish, however harmless, is allowed in the pond. The tench is related to the carp, but it spawns 4 to 5 weeks later, so there can be no danger of cross-breeds.

Great care should be taken that no gold-fish (*Cyprinus carpio auratus*) or bream (*brama*) get in the pond, for these fish would soon mix with the carp and tend to degenerate the breed. Such fish should therefore be removed or killed at once. The gold-fish, especially the milter, swims in spawning-schools like the carp, and at the very same season. It thus spoils the eggs of the carp, as all eggs which it impregnates will produce spotted fish, having at least a silvery streak ¼ to ½ inch long and ⅛ inch broad, between the caudal and the dorsal fin. Such bastards (the cross-breeds of gold-fish and *Carassius* also resemble them) do not grow larger than gold-fish, and have as many bones. They are unfit

Fig. 2.



B A Cross-section of pond through breeding-place.

for table-use and entirely unsuited for ornament, as they are neither genuine carp nor gold-fish, and are disagreeable objects in the eyes of the scientist or connoisseur. If such fish are not removed immediately the consequence will be another cross-breed during the next spawning-season, for such a hybrid spawns, like the gold-fish, when it is a year old, and the breed of carps would degenerate still more. It is best to kill such worthless cross-breeds at once, as they are apt to give great trouble.

I would embrace this opportunity to impress upon every carp-culturist who intends to make breeding-experiments with any carp procured through the United States Fish-Commission, the importance of having if possible only *one* of three above-mentioned kinds of carp, unless he can have every kind in a separate pond. Thus, the common carp (*Cyprinus carpio communis*) should never be placed in the same pond with the "mirror-carp" or the "leather or naked carp" (*Cyprinus carpio alepidotus*, *coriaceus vel nudus*), nor should the two last-mentioned varieties ever be in the same pond. Cross-breeds would invariably be produced, and in such a manner that one would have neither genuine common carps nor genuine mirror or leather carps, but a cross-breed of all the three varieties. Not even when quite young and not yet capable of spawning should these varieties be put together, because, even if they are kept strictly separate during the spawning process, the young

fish would never have the sharply-marked characteristics of their variety as regards form and color, but would approach nearer to the "mirror-carp" and the "common carp." The carp has a striking tendency, when living with other varieties, to approach the primitive form of the common carp, and finally to be merged in it. These beautiful varieties should therefore be kept strictly separate; lack of ponds or any other reason should never induce people to mix them.

If the breeding-experiments are to be accompanied by good results, a pure variety should be selected, and the finest and best milters and spawners, showing strongly all the characteristics of their variety should be procured, and the experiments will be crowned with success.

I must return to the so-called "mixed culture," by mentioning that it is not to be recommended. In Central Europe it is never practiced by scientific pisciculturists but only by small operators mostly in so-called "peasants' ponds." This method does never yield a certain and truly profitable result.

7.—FEEDING THE CARP.

In conclusion I will make some remarks on the feeding of carp in close ponds. It is not every natural pond which is a good pond, having the essentials of a good soil at the bottom and capable of producing sufficient food for the fish. If these conditions are wanting, the fish must be fed. This is as a general rule only necessary in ponds with sandy bottom without any clay. As I have said before, I am *not* in favor of feeding fish, as my standpoint is that of the rational culturist sharing the opinion with most of the prominent pisciculturists of the Old World, that the carp should find its own food in the ponds.

If, however, the nature of the bottom demands artificial feeding, or if suitable food can be had at a remarkably cheap price, the feeding should be done with great caution. Never feed in one and the same place; even if the pond be very large, distribute the food in different places near the banks. If the food is always put in one place or even if it is distributed over two places, the carp will stay in the neighborhood of these places, will become languid, and instead of scouring the other parts of the pond in search of food, will remain at the bottom. It will even if surrounded by the richest food, grow fat, but never have any firm flesh; nor will it ever grow much in length, as the somewhat phlegmatic fish does not get the exercise which favors its growth.

Never give them much food at one time, but by degrees, in small quantities, never during the day but either early in the morning or in the evening. During the hot season only feed them late at night, because the carp, if it has eaten sufficiently in the morning, will remain at the bottom all day, while during the higher temperature of the water it is necessary for its health that it should swim round and get a change of water. It is therefore useful to place in ponds containing large carps a limited number of pike, which, however, must be smaller than the carp. The carp fears the pike and flies from it. If there are pike in

the pond, the carp will get more exercise and will seek natural feeding-places, whither on account of its innate sluggishness it would never have gone.

Pond-carp are accustomed to other food than the river-carp. The former confine themselves to worms, larvæ, and plants, while those living in streams find all sorts of animal and vegetable refuse; these latter can also stand a greater amount of food, as the current naturally makes them take more exercise thus increasing their appetite. It is different with the pond-carp; if you give it too much food, it will not take any more than is necessary to satisfy its hunger; the remnants will remain at the bottom, and if their quantity be considerable, they will spoil the water. If these remnants are chiefly animal refuse, as flesh or blood, fungi will grow on them, and will then produce, as with the salmon and trout, diseases of the skin, the gills, and in the case of the carp, sometimes internal diseases.

The writer once had the following experience: During his absence a number of large carp were fed on coagulated blood which had begun to putrefy; the fish devoured it eagerly, got sick, and most of them died in a few days from an inflammation of the intestines. Spoilt food should never be given to fish. If slaughter-house or kitchen refuse can be had, give these, chopped up small about the size of peas. Never give so much that remnants remain for any length of time in the water and begin to putrefy. Let no one be induced by the circumstance that the carps like to eat the dung of hogs, sheep, and cows, to feed them on any putrefying matter. There are instances on record that thereby epidemics, particularly diseases of the scales have originated.

The carp likes above everything else vegetable matter such as cabbage, lettuce, boiled potatoes, corn, turnips, pumpkins, melons, &c. The refuse of malt from breweries and distilleries, is also very good food for carp; and wherever such refuse can be had, it should be given to the fish.

The small pisciculturist, having a pond of perhaps 1–2 acres near his house, will often be able to feed his fish on refuse, as he will always have it fresh from the kitchen and stable.

In conclusion, I earnestly recommend the culture of the carp to all pisciculturists. If the value of the carp for table use has once been recognized, it will become a highly esteemed fish, especially in the neighborhood of large and populous cities, and its culture will yield a larger and more certain profit, than the expensive trout.

8.—EXTENT OF CARP-CULTURE IN EUROPE.

In Europe many thousand acres of artificial waters are to be found. In these enormous quantities of carp are bred. Some of these ponds, or rather lakes, have an extent of about 1,000 to 2,000 acres. They are provided with gigantic dams, many of them 60 feet high. By these the water is closed in into broad valleys, containing no other fishes than carps from 4 to 5 pounds in weight. If we consider the size of these

lake-like ponds, surrounded by enormous dams which are overgrown with oak-trees 100 to 300 years old, series of three and more of these lakes being not uncommon, then we can form some idea as to the remunerativeness of these establishments, particularly in Bohemia.

The standard establishment with regard to the most extensive business transactions is found in Austria. The Prince of Schwarzenberg, of whom I have spoken previously, possesses more than 250 ponds of large size, the smallest having about 10 acres, the largest 2,000 acres water extent.

We find many villages where ponds of 50 to 200 and more acres are maintained at the expense of the community.

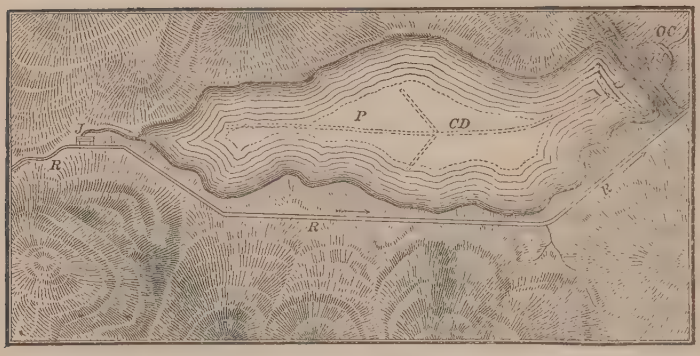
9.—THE TABLE QUALITIES.

If the carp were a fish of inferior quality, like the buffalo-fish, for instance, its sale would doubtless be limited to the sea-port towns of Northern Germany and the principal cities of Central Europe, as Vienna, Berlin, and Paris. In the latter city, in spite of an abundant supply of salt-water and different kinds of fresh-water fish, the carp is ever preferred to these, and, with the exception of trout and salmon, it frequently commands a price three times as high as that of all the rest.

I maintain my assertion that the carp, whether it be scale, mirror, or leather carp, is one of the most excellent fresh-water fishes, and its introduction will be of great value in point of national economy, especially on account of the facility of its culture and the enormous extent to which this may be carried on.

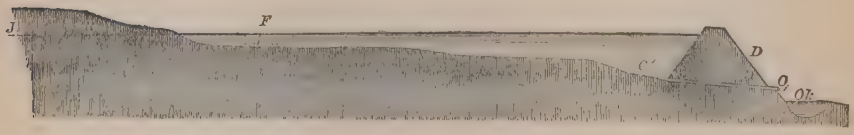
The carp and its value as a fish of culture will before long be fully appreciated, so that we may be enabled favorably to compare the results of its culture in America, as also the extent attained to, with any other country, to our complete satisfaction.

FIG. 3.—Plan of a natural carp-pond.



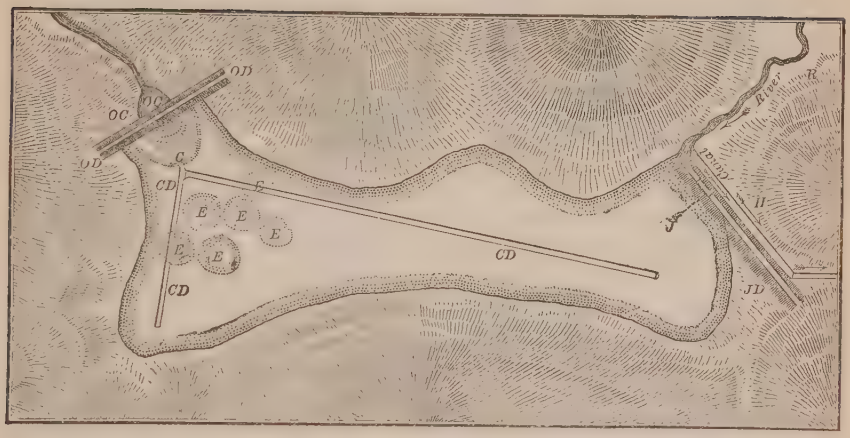
Pond *P* is a natural body of water. Its extent is about one hundred and fifty to two hundred acres. It is formed by a dam, *D*, about seven to eight feet high, crossing the valley and thus collecting the water of a run flowing there. Before *D* is a deepening, *C*, the collector. In the dam *D* there is an outlet leading to another deepening—the so-called outlet collector *OC*. The purpose of this collector is to keep back fishes that may have passed the outlet when opened. It is provided with a screen or netting. *CD*, upon the bottom of pond *P*, is the collector-ditch, which conducts the fishes to *C* when the water is let out, and thus prevents them being caught in the mud. *R* is the run of water which, to prevent overflow, has to be conducted around the pond in a separate ditch, leaving an inlet at *I*, protected by a sluice with screens.

FIG. 4.—Cross-section of carp-pond, fig. 3.



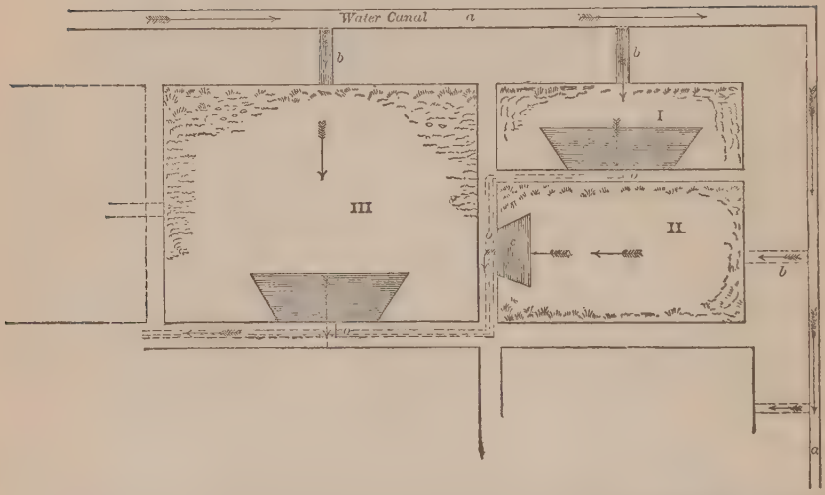
F, surface of the pond; *C*, collector; *D*, dam; *O*, outlet; *OK*, outlet collector; *J* inlet; *R*, stream; *D*, the dam; *R*, the run or creek.

FIG. 5.—Plan of artificial carp-pond.



R, stream supplying artificial pond between undulating hills; *J*, inlet; *JD*, inlet dam; *CD*, collecting ditches; *C*, collector; *OD*, outlet dam; *O*, outlet; *OC*, outlet collector; *E*, cavities, "kettles," in which the carp collect for the winter; *H*, canal to let off surplus water in case of freshets.

FIG. 6.—Plan of artificial carp-ponds.



I, breeding-pond for spawning fishes and spawn; II, pond for small fry; III, pond for large fish; *a*, supply of water; *b*, inlet; *c*, collector; *o*, outlet.

VIII.—THE PROPAGATION AND DISTRIBUTION OF SHAD.

A—OPERATIONS IN 1876.

By James W. Milner.

1.—STATION ON THE POTOMAC RIVER.

The efforts of previous years to obtain eggs of the shad in the rivers south of the Potomac having yielded very small results, it was thought best not to make the attempt in 1876, but to commence operations on the Potomac at as early a date as possible, so that a long season might furnish the opportunity of obtaining the largest possible number of eggs.

The steam-yacht Lookout came up the river during the commencement of the work, bringing Mr. T. B. Ferguson, commissioner of fisheries for the State of Maryland. Throughout the remainder of the season, on the Potomac and the Upper Chesapeake Bay or mouth of the Susquehanna River, our efforts were combined.

On May 8 a camp was established at Ferry landing, near Mount Vernon, Va., and Mr. Frank N. Clark placed in charge. The seine-hauls were sedulously watched, but no ripe fishes were taken until the 13th. From that date until the 24th eggs were taken almost daily, either at the Ferry landing fishery, or from the trips of the dispatch-boat Lookout to other fishing-shores of the Potomac. In all, 686,000 young fishes were hatched, of which about 100,000 were shipped to North Carolina, and the remainder put into the river.

The catch of shad was remarkably small along the river, the hauls of the 1,000-fathom seines bringing in such quantities as 125, 130, rarely 200 at a time.

There are few places in the wide portion of the Potomac where there is sufficient shelter for the hatching-boxes. During this season, many eggs were washed out by the tossing of the boxes during high winds. A boom of double logs is an essential protection to the boxes.

The seines along the river "cut out" before the 23d of May, as the fishing proved a failure and expenses were much greater than the income.

The disposition of the fish hatched will be seen in the tables on a subsequent page.

2.—STATIONS AT THE HEAD OF CHESAPEAKE BAY.

Mr. Ferguson had the work near Havre de Grace, Md., in the region of the mouth of the Susquehanna River, under way on the 9th of May, and long before the camp was broken up at Ferry Landing, Va., a large number of fishes had been hatched and turned loose in the river mentioned. Swan Creek, Carpenter's Point, Havre de Grace, where the fresh waters of the Susquehanna enter the extreme head of Chesapeake Bay, were the localities chosen as stations.

Carpenter's Point was the first station, and was continued between May 10 and May 31. The report of the operator, W. F. Wroten, gives 1,725,000 eggs taken, 1,660,000 fishes hatched, of which 822,500 were released at the station, and 837,500 shipped away.

Swan Creek Station No. 1, conducted from May 26 to June 3, as reported by W. H. and J. H. Hines, had in the boxes 280,000 eggs, producing 125,000 fishes, and 80,000 of these were turned loose from the boxes, while 45,000 were shipped away.

Swan Creek Station No. 2, carried on from June 1 to June 10, collected 630,000 eggs; hatched 525,000 fishes; turned loose 200,000 fishes, and shipped away 325,000.

Havre de Grace Station No. 1, operated by F. N. Clark, begun May 28 and ended June 14, gathered 960,000 eggs and hatched 862,000 fishes; 272,000 were turned loose, 590,000 were shipped away.

Fishing Battery Station, near Havre de Grace, between June 3 and June 26, obtained, according to William Hamlen, in charge, 536,000 eggs, producing 459,000 fishes, all of which were released at the station.

Havre de Grace Station No. 2, conducted by W. H. Hines, from June 12 to June 20, from 190,000 eggs produced 110,000 fishes, all of which were turned into the river.

The total productions of these stations from the above reports were 4,321,000 eggs; 3,741,000 fishes; 2,143,500 turned alive into the waters of Maryland, and 1,597,500 shipped away.

The seines "cut out" early in this region, and the later work of the stations depended on the drift-nets for the supply of parent fishes. A great scarcity of ripe males prevailed throughout the season, and this reduced the total of fertile eggs very much, as well as the production from eggs placed in the boxes.

The attacks of the eels upon the shad hanging in the nets were sometimes very destructive. Often half of the catch, as it was thrown into the boat, would be found to be the heads and back bones of shad, from which the meat had been stripped by the eels. One fisherman in the vicinity gave his whole attention to the capture of eels, and made a good living from it.

The accounts of the early abundance of shad and herring in this vicinity were similar to those from the Potomac and many regions of the Atlantic coast.

Mr. C. H. Bogel, now fishing at Havre de Grace, Md., about forty years ago sailed the sloop Bowman Williams between Philadelphia and Port Deposit, Md. In the spring of 1837, in the month of May, while at the southern end of the route, a haul was made with a 1,000-fathom seine which contained so large a number of fish that it occupied the better part of the day to get the seine on shore. From this single sweep of the net were taken 2,700 barrels of "herring," (*Pomolobus pseudo harenges*,) or about 1,350,000 "herring." Besides the herring, there was a large number of shad—"many thousands." Another fisherman spoke of a famous haul of shad, where 30,000 were brought on the shore.

3.—STATION ON THE CONNECTICUT RIVER AT SOUTH HADLEY FALLS, MASS.

This station was established at South Hadley Falls on the 3d of July. Mr. A. D. Hager, formerly commissioner of fisheries for the State of Vermont, took charge of the field-work, and arrived several days before the spawning fishes were ripe. Not until the date referred to were the first eggs taken. The temperature of the water was very high. Mr. Hager records it on the 3d as at 81°, and from that to the 20th it increased to 86°. The level of the river, because of the hot, dry season, was very low.

The seine was hauled on two fishing-grounds, below the bridge at South Hadley Falls and at Willimansett, as from time to time the different grounds seemed to offer the better prospects; for a time, both fisheries were made use of. On the 16th and 20th there were no seine-hauls made. The largest number of eggs taken on one night was 300,000, and the smallest, 35,000. Between the 3d and the 20th, 1,480,000 eggs were taken, developing 1,110,000 fishes. All eggs taken subsequent to the 11th died from the excessive heat.

The water attained such a temperature by the 20th that it was found useless to take and impregnate the eggs, no development of the embryo ensuing. The hauls made on the night of the 19th closed the work, and it was determined to stop the fishing until the temperature of the water became much reduced.

On the 24th it was found that the rains at the sources of the Connecticut had raised the river at South Hadley Falls eight inches, and reduced the temperature of the water to 76°. The seine-hauling was again begun, and from this time to August 5, when the station was broken up, eggs were taken in small quantities every night. In this time 900,000 eggs were taken, making the total for the station, between July 3 and August 5, 2,380,000, producing 1,958,000.

Of the young fishes, 645,000 were put into the Upper Connecticut; 199,000 were released at South Hadley Falls; 80,000 were put into the Westfield River; 180,000 were put in the Taunton River; 100,000 were

sent to the Alabama River; 100,000 to the Sacramento River, and 654,000 to the waters of the Mississippi River.

A total of 924,000 shad was returned to the waters of the Connecticut, altogether 1,104,000 deposited within the boundaries of Massachusetts, and 854,000 shipped south and west.

This is the smallest year's work ever done at this station. The assertion made by residents that the river was lower and the water warmer than ever before known in the Connecticut seems quite probable.

The entire season's work figures out the total from the reports of those who deposited the fishes in thewaters at 5,877,500 shad in the streams of the Atlantic slope, the gulf rivers, the tributaries of the Mississippi, and the Sacramento River of the Pacific coast.

B—TABLES OF SHAD-PROPAGATION IN 1876.

Record of shad-hatching operations conducted at Bristol Landing, on the Patuxent River, from May 2, 1876, to May 12, 1876, on account of the Maryland commission of fisheries, by William H. Hines.

IX.—ON THE COLLECTION OF EGGS OF SCHOODIC SALMON, IN 1875 AND 1876.

By Chas. G. Atkins.

A—NOTES ON THE SPECIES.

1.—NOMENCLATURE.

There are in the State of Maine four lake systems known to be inhabited by fresh-water (or "land-locked") salmon, namely the systems of Sebago Lake, of Sebec Lake, of Union River, and of the Saint Croix River. Specimens from the Saint Croix have been critically examined by Dr. Suckley and placed by him in Dr. Girard's species, *Salmo sebago*, which latter was based on specimens from the Sebago region. A single specimen of the young of the Union River fish, examined by Dr. Girard, has served to connect the fish of that locality with those of the Sebago and Saint Croix. From this single specimen Dr. Girard erected the species *S. gloveri*, and many writers have, with what reason I cannot see, considered this name applicable to the Saint Croix fish; but Dr. Suckley pronounces *S. gloveri* to be synonymous with *S. sebago*, and would thus establish the identity of the fresh-water salmon from three of the systems named. I do not know that the result of any studies on the salmon of the Sebec waters has been published, but if Dr. Suckley's decision as to the specific identity of the other three varieties stands, doubtless the Sebec fish must go with them as constituting a fourth variety of the species *Salmo sebago*.

I think I am certainly warranted in speaking of the fresh-water salmon of the different localities as different varieties. My observation has been but superficial, to be sure, but I have examined and handled a large number of specimens from the Sebago and Saint Croix waters, and quite a number from Sebec, and the apparent differences among them have been quite marked. Of these three, the Schoodic and Sebec fish are much alike, agreeing very well in size (not an important point) and differing in general appearance less than the Schoodic and Sebago fish. The latter is far the largest of the three, and bears, at the spawning season, when only I have seen it, a much stronger resemblance than either of the others to the sea-going species, *Salmo salar*. The salmon of Union River I have never seen, but from descriptions received, conclude that they closely resemble those of the Sebago, being large, stout-built fish.

The term "land-locked salmon" by which these fish are generally known seems to imply that they are or have been at some time shut out from communication with the sea and thus forced to pass all their lives in fresh-water. There is, indeed, a very prevalent theory that the fresh-water and sea-going salmon were originally identical, and that the distinguishing characteristics of the fresh-water species are the result of a forced or voluntary residence in fresh water. However this may be, there is no evidence that the supposed change of habits—the abandonment of the seaward migrations—came about in any such way as the name "land-locked" implies. A natural impediment sufficient to shut in the salmon and prevent their reaching the sea may perhaps have occurred by some convulsion of nature during a former geological age, but not in the present. The artificial obstructions that man has erected, though sufficient to prevent fish ascending, have never constituted any serious obstacle to their descent. The alleged original discovery of the species in some of the localities in recent times does not rest on sufficient evidence.

2.—DISTRIBUTION AND HABITS OF SCHOODIC SALMON.

The operations detailed below had to do with the Schoodic variety, best designated as the "Schoodic salmon," inhabiting the lakes of the Saint Croix River.

In proportion to its size, the Saint Croix has a more extensive lake system than any other river on the Atlantic coast of the United States (the Saint Lawrence not included in the comparison). The most of the water passes through successive lakes, which serve as vast basins for the deposit of sediment, and is thereby purified to a remarkable degree.

The range of the Schoodic salmon was formerly through all parts of the main Saint Croix from tide-water upward. Once it was often caught at Salmon Falls, less than a mile above the flow of the tide, and various other places are pointed out on the lower part of the river where the sportsman of thirty or forty years ago could always find them at the proper season. It is only a few years since they were abundant at Princeton, the outlet of the western chain of lakes, and at Vanceborough, the outlet of the eastern chain. Latterly it has almost or quite disappeared from the main river, and is scarce at Princeton and at all points on the east branch. In many of the lesser lakes and streams of the region it has also become quite scarce within a few years. It is still found, however, in Big Lake occasionally, in West Musquash Stream and Lake, in Grand Lake and Stream, in Pocumpus Lake, in Sysladobsis* Lake and Stream, Sysladobsis-sis Lake (or Upper Sysladobsis), and the stream bearing the same name; also in Junior Lake and Stream, Scraggly Lake, and Pleasant Lake. All these waters are tributary to the

* The aboriginal name is pronounced Sich'-la-dob'-sis, the *ch* having a guttural sound as in German. The whites commonly shorten it to "Dobsis" or "Dobsy." Sysladobsis-sis means *Little Sysladobsis.*

west branch or Schoodic River. There are no facts at command relative to its distribution in the lakes of the east branch of the Saint Croix, except that it is now exceedingly scarce in all that region.

The proper home of the Schoodic salmon is in the lakes mentioned above. The streams are resorted to mainly for the purpose of reproduction, but to a very considerable extent for the purpose of feeding. There are two migrations yearly from the lakes to the streams. The first is the spring migration, performed for the sole purpose of feeding. The second is the fall migration, performed for the sole purpose of reproduction. The spring migration begins in May, is at its height in June, and ceases in August, either by the death of the migrated fish at the hand of the sportsman or by their return to the lakes. The fall migration begins in September, but takes place mostly in late October and early November, and ceases at the beginning of winter; such fish as may have survived returning then to the lakes.

These migrations do not answer very well to those of the sea-going salmon. The spring movement is indeed hardly entitled to the term "migration." The autumnal movement is well defined and complete, and answers to the only observed migration of sea-going salmon, yet it occupies much less time, is accompanied by a very limited abstinence from food, and involves no change of element like that from salt to fresh water.

The spring migration is not participated in by all the salmon, although probably all of them are at that season busily feeding. They are to be found in greater or lesser numbers in all parts of the lakes inhabited by them, and are taken by bait at the surface of the water. That is the season when insects are most abundant, and it is probably mainly the pursuit of these that attracts the salmon to the streams and to the surface of the water.

Though there appears to be reason to call the late spring and early summer the feeding season, it does not appear that it is exclusively so. There is no part of the year, with the possible exception of the spawning season, when it is impossible to catch salmon with a baited hook. Yet it would be too much to assert, in the present state of our knowledge on the subject, that all of them continue to feed through the late summer months, or even that feeding is general among them at that season. The retirement to the depths of the lakes in midsummer may indicate either a general cessation from feeding or merely a change of food, as that occurring in the deep waters would, most likely, be different from that found in the shallows.

Of the precise sort of food taken by the salmon, but little can be said for want of definite observations. It is the general belief that they feed largely on insects, and probably this is correct. They are also known to feed more or less on small fishes. There is a species of smelt in these lakes, attaining a maximum length of about four inches, which is pursued by the salmon. At various dates in February, March, and April

the smelts enter small tributary brooks to spawn, and the salmon are then taken around the mouths of the brooks and found to be gorged with smelts.

At the time of the spring migration, the salmon that take part in it are generally in their highest physical condition, heavier (in proportion to their length, at least), and more active than at any other season. The sexes are not easily distinguished. Both are of a fine silvery color, white beneath, bluish or greenish-gray above, with black spots on the sides and backs. Compared with sea-going salmon, they are only one-sixth or one-eighth as large, but in appearance and action the resemblance is very close. They are less fat and the flavor of the flesh is thought to be more delicate. By old salmon fishermen the fish is thought to bear a striking resemblance to the grilse or partly-grown salmon of Canadian rivers. In purely game qualities, probably this fish has no superior, and no equal among the salmonidæ of the United States. When in season, the fly is taken eagerly, and when hooked the fish fights fiercely, leaping repeatedly into the air to free itself. The average weight, at this season, of the fish frequenting Grand Lake Stream would, I think, be very near a pound and a half. Those of Dobsis Lake and of West Musquash Lake are somewhat larger, while those of Pleasant Lake are smaller.*

The approach of cool weather in September is the signal for the commencement of the autumn migration. In Grand Lake stream a very few fish are first seen in the stream, or reconnoitering the approaches to it, very early in the month. Their numbers slowly increase, and if their way is unobstructed, they pass down and soon occupy the whole length of the stream, feeding all the time when opportunity offers. They become daily more plenty until spawning begins, which is between October 20 and 31. Though many have by this date already sought the stream, there is still a larger number of spawners waiting their development in the lake, and not descending into the stream until their maturity is close at hand. The date of the spawning varies somewhat from year to year. In general, it may be said that the greater part of the fish spawn between November 1 and 10; but the operation goes on actively until the 15th, and a few fish are later still than that. In some seasons a large part of the spawn is believed to be laid during the last half of November. The phenomena thus far observed seem to indicate that warm weather hastens the spawning, and cold weather retards it. Thus, in 1875 more than half of the spawn obtained at Grand Lake stream was taken after November 23, while in 1876 not any was taken so late as that.

The migrations into Grand Lake stream are, in the main, downward movements from Grand Lake. It is not known whether any fish ascend

* The Union River and Sebago varieties attain a much larger size. In 1867 I observed the Sebago fish through the spawning season, and found the average weight of the males to be about five pounds, of the females a little more than three pounds; and single specimens have been taken weighing seventeen and a half pounds.

the stream from Big Lake or not. Probably they do, but not in large numbers; so little was expected from this source, that it has been entirely neglected in the spawn-gathering operations. In Dobsis stream, a similar state of things exists; nearly all the fish frequenting the stream for spawning, descend into it from Dobsis Lake; a very few ascending from Pocumpus Lake, and this, in spite of the fact that the head of the stream is obstructed by a dam which renders it very difficult for either old or young fish to return to the Dobsis Lake, while passage between the stream and Pocumpus Lake is quite unobstructed and easy. Whatever may be the cause, it appears that these fish when seeking spawning-ground are more likely to move down stream than up stream. It is supposed that they always enter streams to spawn unless shut out by some extraordinary obstruction; but this is not positively known to be the case.

The fish that earliest seek the stream at the approach of the spawning-season are mostly males. But as the season advances the females become more numerous, and of the whole number visiting the stream, the females have, during these two seasons, been in the decided majority. The sexes invariably consort in pairs, but it does not appear that the pairing takes place till the female is about to spawn.

The spot chosen by the pair for a spawning-bed is in a strong current of water, one or two feet deep, on a bottom of coarse gravel or small bowlders. The operation is generally performed at night, but has been often observed on a cloudy day and very rarely in sunshine. The two salmon lie on the bottom near each other, the male two or three feet farther down stream and a little to one side from the female. Occasionally the female turns upon her side and fans violently against the bottom with her tail, loosening up the gravel and moving it by the help of the current, a few inches down the stream, where it is deposited in the form of a small mound. In this mound the eggs are supposed to lie buried. The male is occupied most of the time in driving away rivals, chasing them off for a few feet and sometimes several rods, and returning from each sally to the exact position occupied before. Occasionally he is seen to approach close to the female, and lie for a few seconds by her side.

When spawning begins, the temperature of the water in the stream is about 47° F., but before the eggs are all laid it has cooled to below 40° F. During the winter, it varies but little from 33° F. The eggs are believed to hatch about the first of May.

B—SPAWN-GATHERING IN 1875

1.—GENERAL PLAN OF OPERATIONS.

None of the other breeding-grounds of the Schoodic River, and probably not all combined, are frequented by so many fresh-water salmon as those of Grand Lake stream. Here, then, of course, it was decided to

undertake the capture of fish and spawn. These grounds had been occupied for the same purpose several times before by sundry parties, and there existed, at a spring half a mile from the stream, the ruins of a small hatching-house built in 1869 by the States of Maine and Massachusetts. To avoid the expense of rebuilding the hatching-house and maintaining an establishment through the winter and spring, it was decided to arrange with the Dobsis Club to have the eggs cared for at their hatching-house, fifteen miles distant, no doubt being entertained of water communication remaining open until the close of the spawning-season.

Grand Lake stream receives the waters of Grand Lake and pours them into Big Lake. Its length is about two and a half miles, and its volume at a very low stage is about one hundred and thirty-eight cubic feet per second. Its water, as it comes from Grand Lake, is exceedingly pure. Its bed consists mostly of gravel and small bowlders. Its current is mostly rapid. There is a large extent of ground which was well adapted to spawning purposes until 1870, when a tannery was erected near the head of the stream, and from time immemorial the salmon of Grand Lake have come down into it in large numbers every autumn to lay their eggs. The outlet of the lake is now commanded by a dam, but it is of the sort known as a "driving dam," used for storing water for the purpose of assisting the driving of logs; the water is never allowed to flow over the top of the dam, but through spacious gates which admit the passage of fish to and fro at almost all times.

The very best place to catch the salmon is close to the outlet of the lake, as they first enter the stream. About two hundred feet below the dam is a stretch of gravelly shallows where a man can wade any time during the spawning-season quite across the stream. Here a net suspended on stakes was stretched diagonally across the stream, leading at its lower end into a set of inclosures (also of netting), constructed after the manner of fish-weirs, so that the fish could easily enter but could not escape. The nets used were all of a mesh too small to gill the fish. The largest inclosure was about seventy feet long and forty wide, and had about five feet of water in the deepest part. In this it was intended for the bulk of the fish to lie while awaiting maturity of the eggs. Various other smaller inclosures were to serve for assorting the fish, to separate those spawned from the immature, &c. A rough shed was built to shelter the working party. Overlooking the whole on the bank of the stream, a cottage was built to serve the purposes of work-shop, store-house, and lodging and boarding house.

The necessity of transporting the eggs fifteen miles and of caring for them (perhaps for a week or ten days), while awaiting shipment, and guarding against a possible interruption of communications, compelled me to devise a new piece of apparatus. I must have something that would receive the eggs and hold them securely, that could be placed in a running stream and admit a free passage of water through from side to

side, and that could be inclosed in a box and transported to Dobsis stream, without disturbing the eggs. All these conditions were fulfilled by a nest of wire-cloth trays inclosed in a frame of which the front and top swung open at pleasure, allowing the trays to be placed or removed, and which, when closed, held the trays firmly in place. The trays were placed one upon another, but by making the corners of extra thickness an open space one-eighth inch wide was secured on all four sides above each tray. This contrivance proved to be very useful both in the open stream and afterward in troughs of a hatching-house. For purpose of transporting eggs in case of land journeys trays bottomed with cotton flannel instead of wire-cloth were provided, but never brought into use.

2.—TAKING SPAWN.

The main net was put across the stream October 9. This prevented any of the salmon passing down after this date and getting out of our reach. The inclosures were not, however, put into shape to retain fish until October 28, it being thought better to allow them freedom as long as possible. After this date they collected rapidly, but as they passed without our interference into the large pound the number inclosed could not be accurately known until they were all seined out of that pound, which was not done until October 24. They appeared to come down in greatest numbers during the first week in November; but they continued to come until November 20.

The first indications of the maturity of the fish were observed October 28, when two partly-formed ridds (or nests) were found just above our nets. No attempt was, however, made to take spawn until November 6, when, out of forty-eight female fish examined, twenty-five were found ripe, and relieved of their eggs. The spawning proceeded from day to day rather slowly until November 20, when the total number of eggs obtained amounted to 550,000. On the 24th, we attacked the main pound where there remained quite a body of fish. We finished handling these on the 26th, and found among them twenty-nine unripe females. Severe weather prevented the completion of the spawning operations until December 8, at which late date two of the female fish still remained unripe. The total number of Schoodic salmon was 2,628, consisting of 1,055 males, 1,571 females, and 2 of unknown sex. The eggs obtained were estimated to amount to 1,077,500.

Uncommonly severe weather was experienced during this season. The ground began to freeze in October. Snow fell on eight days of November. On the 18th of November the temperature of the air fell to 13° F., and ice closed our communications with Dobsis stream while as yet but half our spawn was taken. November 23 the mercury fell to —3° F., and November 30 to —16° F. in the morning and —7° F. at midday. With such weather the working of nets and the handling of fish and spawn was far from being an easy task.

Finding that the route to Dobsis stream was closed, I was compelled to improvise a hatching-house out of the ruins of the old one at the spring referred to above. Fortunately we had an abundance of apparatus, and it being very compact, a single trough about twenty-five feet long was room enough for the half-million spawn which was to be deposited there.

Very few other fish than Schoodic salmon were taken in the pounds. The number of brook-trout (*Salmo fontinalis*) did not exceed a dozen; of togue (*Salmo toma?*) barely two were caught; of whitefish, ten; of eels, not exceeding half a dozen; of *Cyprinidæ* there were a good many suckers, and great numbers of chubs and shiners passed at will through our nets.

There was taken a single specimen of *Salmo salar*, a female of about thirteen pounds' weight; she yielded 10,000 eggs, which were impregnated with the milt of the Schoodic salmon; they developed well, hatched into vigorous fish, which were afterward deposited in Williams pond, in Bucksport.

3.—DISTRIBUTION OF THE EGGS.

The eggs at Grand Lake stream were divided early in February, 1876, and those at Dobsis stream in March. On measuring all the spawn, there were found to be 933,000 eggs. Of these, 265,000 were left to be hatched for Grand Lake stream (being 32,000 in excess of the proper quota of 25 per cent.). The remainder were divided among the several parties bearing the expense, namely, the Fishery Commission of the United States, of Connecticut, Massachusetts, Rhode Island, Vermont, and Wisconsin.

The share of the United States was 159,000, which were distributed as follows:

To Vermont	14,000
Connecticut	14,000
Pennsylvania	8,000
Virginia	4,000
Ohio	12,000
Michigan	18,000
Wisconsin	24,000
Minnesota	10,000
Iowa	10,000
Illinois	20,000
Tennessee	4,000
New York	11,000
Dominion of Canada	10,000
Total	159,000

C—SPAWN-GATHERING IN 1876.

1.—PREPARATIONS.

The impracticability of using the hatching-house of the Dobsis Club for the development of spawn taken at Grand Lake stream was sufficiently demonstrated by the experience of the previous year. The temporary hatching-house at the spring was therefore removed, and a better structure put in its place. The new house was 20 feet wide and 30 feet long, and allowing half its interior for stove-room, tables, working-room, &c., the remaining half afforded room for six troughs, each 22 feet long, one foot wide, and nine inches deep, which, when fitted with the compact apparatus devised and brought into use the preceding year, would accommodate, at the utmost, 2,400,000 eggs. I should have preferred to use the water of the stream as being, on the whole, preferable for fish-hatching, but no practicable site could be found, except we resorted to the expedient of raising the water artificially, which it was not deemed best to do.

There was no change of importance made in the details of the hatching apparatus nor in the fixtures and implements for catching and managing the fish and taking the spawn.

2.—TAKING FISH AND SPAWN.

In 1875, the nets had not been placed until the movement of fish into the stream had been going on several weeks, and consequently a good many of the fish had passed down below our fishing-ground, and therefore out of our reach. This year the precaution was taken to put in the main nets on September 20, only four days after the beginning of the close-season. By this means nearly or quite every fish that would come into the stream was kept above our nets, and but a small number escaped eventual capture.

Notwithstanding this husbanding of our resources, however, the season was not destined to be so successful as the first had been. There was, undeniably, a great falling off in the number of fish seeking the stream, owing to some unknown cause that operated before the recent attempt to cultivate them.*

The inclosures were all completed October 24, and the capture of salmon then commenced. The precise date of the first spawning among the free fish in the open stream was not observed, but many pairs had been at work on the gravels before October 30, and it was at that date quite evident that the fish were spawning earlier than the previous year.

Taking spawn began November 6, when all the fish that had entered the pounds up to that date were examined and found to count 337, there

* Happily this was only a temporary depression. The next season (1877) shows a great increase over both 1875 and 1876.

being 132 males, 205 females. Of the females, 167 were ripe and full, 17 unripe, and 21 spent. The fish continued to come in until November 22, when it became evident that the run was at an end. All the females caught had yielded their eggs, and only spent-fish could now be caught. The whole number of fish taken was 1,021, there being 272 males and 749 females. The number of eggs secured from these fish (670 females yielding spawn) was 530,500, and 12,500 more were obtained from the neighboring West Musquash Lake, making a total of 543,000.

3.—DEVELOPMENT AND DISTRIBUTION.

The development of the eggs did not proceed with the usual success. Eighty-three thousand were rejected before distribution, and a portion of the remainder were injured in some unexplained manner, so that a very serious loss was experienced in their subsequent hatching.

The number divided was 460,000, of which 115,000 were retained for the benefit of Grand Lake stream; 145,000 were distributed on behalf of the United States commission, and 200,000 sent to Massachusetts and Connecticut.

The share of the United States was distributed as follows:

To Maine	8,000
Connecticut	10,000
Massachusetts	10,000
New Hampshire	10,000
New York (S. Green)	7,500
New York (F. Mather)	2,000
Maryland	7,500
Virginia	10,000
Tennessee	20,000
Ohio	4,000
Michigan	4,000
Illinois	10,000
Wisconsin	7,000
Iowa	10,000
Minnesota	20,000
California	5,000
Total	145,000

X.—OPERATIONS ON THE McCLOUD RIVER IN SALMON BREEDING, IN 1875.

By Livingston Stone.

A.—PREPARATION.

On the 16th of June I arrived at the McCloud River and found preparations already progressing. The shallow trays were changed to deep ones, and the troughs remodeled, so that the capacity of the hatching-apparatus reached a maximum limit of about 12,000,000 eggs. On the 8th day of August the river was virtually closed to the salmon, although there were still a few places where by great exertion a few smaller ones succeeded in getting by. On the 12th of August the obstruction of the river was complete. After this the salmon collected in great quantities in the river below the bridge, and, as it happened last year, occasionally made raids upon the bridge in vast numbers.

The bridge and dam having been completed, we proceeded to erect a flume from the wheel to the hatching-apparatus and to place the filtering-tank and the troughs for the eggs. Several new hatching-troughs were built; the trays and all the wood-work were covered with a fresh coating of asphaltum. A large double corral was built at the fishery for receiving the parent salmon from the seine, and things were made ready generally for the approach of the spawning-season.

B.—THE SALMON-EGGS.

1.—TAKING SPAWN.

Some of the salmon which were caught the first week of August had eggs so nearly ripe that it was generally predicted that the spawning-season would begin earlier than usual. But so regular is the course of nature in this particular that I felt quite confident that this season would be no exception to the common rule, in accordance with which the McCloud River salmon at this point begin to spawn about the 1st of September. My expectations were verified as the month of September approached, and the first ripe eggs which we obtained in any considerable quantity were taken on the 2d day of September. The salmon were at this time collected in vast quantities below the dam. There were so many that in a space of twenty yards wide by a hundred long I have counted one hundred salmon jumping out of the water within the space of a minute. When one reflects that this is at the rate of six

thousand an hour, an idea can be formed of the great number of fish collected there.

From these evidences of the abundance of salmon we naturally expected that when we came to haul the seine it would be pretty good fishing. We were not disappointed, and the first haul of the seine brought in, as nearly as could be estimated, 1,500, which, at an average weight of 20 pounds each, would make 30,000 pounds. The seine, of course, could not be hauled ashore, so after taking out a hundred or so to try them, the seine was reversed and the fish released.

As a natural consequence of the abundance of salmon the yield of salmon-eggs was unprecedented.

Last year, with a total of 6,000,000 for the season, we beat the world by two or three millions, but this year we took 50 per cent. more than last year. This great success, however, was not without its disadvantages, for the increased work of spawning came very hard on the men. To hold and spawn a 20 or 30 pound salmon is no slight task, and to spawn six tons of them a day is something that no one who has not tried it knows the severity of. The physical exertion required to hold the struggling and powerful fish, and to press out the eggs or milt, is very considerable. But this is not all. The men are wet from head to foot all day, and constantly exposed to scratches from the bony rays and cuts from the poisonous teeth of the male salmon. So serious a disadvantage is this latter circumstance that after two days' spawning the hands of the operators, and often their feet and other parts of their bodies, become very sore and painful. The stooping position in taking the eggs is very trying to the back. And the constant soaking of the limbs with cold water brings on rheumatism and a sense of great lassitude at night, all of which combine to make the taking of the spawn on a large scale an extremely severe and trying labor.

The handling of so many eggs also involves the employment of a great deal of help, and in this remote place it is difficult to obtain competent white workmen. To make matters worse, just at this time, the picking over of eggs comes on, the preparation of the immense amount of moss for packing the eggs, and the making of the packing-boxes, in consequence of which we were very short handed during the month of September, though a large number of hands were employed.

In spite of all disadvantages, nearly 9,000,000 eggs were taken, the daily record being as follows:

Daily record of salmon-eggs taken at the McCloud fishery, California, 1875.

Date.	Number of eggs.	Date.	Number of eggs.	Date.	Number of eggs.	Date.	Number of eggs.
Aug. 31	59,400	Sept. 9	660,000	Sept. 16	397,650	Sept. 23	61,600
Sept. 2	243,100	10	599,500	17	352,000	24	.....
3	228,250	11	986,150	18	120,450	25	75,900
4	546,150	12	.....	19	8,250	26	.....
5	732,600	13	672,650	20	146,300	27	55,000
6	211,750	14	334,400	21	297,450		
7	754,500	15	364,650	22	92,400	Total..	8,629,300
8	629,200						

If necessary, I could have pushed the work so as to have taken 10,000,000 eggs, but I did not do this because it had not been made apparent that there would be a demand for so large a number. As it actually turned out, there were just enough eggs to fill the orders, besides having 2,000,000 to turn over to the California fish commission for California waters. Sixteen hundred and fifty thousand of these were hatched at the fishery and placed in the McCloud River.

The success in maturing the eggs was quite equal to the success experienced in taking them. Mr. Woodbury, who had special charge of the hatching-troughs, estimates that 4 per cent. only were lost in preparing the eggs for shipment. The condition of the eggs was exceptionally good. Nothing could be conceived more faultless than they appeared, and they were as healthy, in point of fact, as they seemed clean and wholesome in outward appearance.

The eye-spots showed in the first eggs on the 18th day of September, nineteen days after they were taken.

2.—Shipment of the eggs.

On the 29th of September the first shipment to the east was made. This lot was made up from eggs taken on the 6th, 7th, and 8th days of September, which were, consequently, twenty-one, twenty-two, and twenty-three days old, the eggs gathered previous to these dates, to the number of 2,500,000, having been reserved for California waters.

The first shipment was as follows:

To C. L. Ditman, Stillwater, Minn	200,000
To S. S. Watkins, Redwing, Minn	200,000
To B. F. Shaw, Anamosa, Iowa	300,000
To N. W. Clark, Northville, Mich	268,000

The second shipment was made on the 1st of October, and is as follows:

To A. Palmer, Boscobel, Wis	80,000
To N. W. Clark, Northville, Mich	480,000
To Geo. H. Jerome, Niles, Mich	800,000

The third shipment was made on the 4th of October, as follows:

To T. B. Ferguson, Baltimore, Md	560,000
James Duffy, Marietta, Pa	480,000
Mrs. Dr. J. H. Slack, Bloomsbury, N. J.	320,000

The fourth shipment was made on the 7th of October, as follows:

To Professor Ellzey, Christiansburg, Va	160,000
William B. Robertson, Lynchburg, Va	160,000
W. H. Cushman, Georgetown, Col	240,000
E. M. Lees, Westport, Conn	480,000
Waldo Hubbard, Truckee, Cal	240,000
Myron Green, Kern River, Cal	240,000

The fifth shipment was made on the 12th of October, as follows:

To N. W. Clark, Northville, Mich.	240,000
E. A. Brackett, Winchester, Mass.	80,000
Samuel Wilmot, Ontario, Canada	80,000
A. A. Reed, jr., Providence, R. I.	240,000
A. P. Rockwood, Salt Lake City, Utah	160,000
Dr. W. A. Pratt, Elgin, Ill.	80,000

Besides these, 50,000 eggs were sent to New Zealand, consigned to Charles Kaeding, San Francisco. There were also 80,000 eggs shipped to Seth Green, Rochester, N. Y., the 18th of October.

Before the earlier eggs were all sent off, those of the California reserve began to hatch, the first fish making its appearance the 4th day of October. The remaining eggs hatched out very rapidly, it being safe to say, I think, that in the latter part of October a hundred thousand salmon hatched every day.

Up to the time of the present writing, returns had been received from the first two lots. These read as follows:

From C. L. Ditman, Stillwater, Minn., who received 200,000 eggs:

"Salmon-eggs arrived in fine condition.—C. L. DITMAN."

From S. S. Watkins, Redwing, Minn., who received 200,000 eggs:

"Watkins got eggs in good order on sixth.—R. O. SWEENEY, Fish Comr."

From B. F. Shaw, Anamosa, Iowa, who received 300,000 eggs:

"The spawn arrived in fine condition.—B. F. SHAW. Per SLOCUM."

From N. W. Clark, Northville, Mich., who received 268,000 eggs:

"One lot of eggs arrived yesterday in good condition.—N. W. CLARK & Co."

From George H. Jerome, Niles, Mich., who received 800,000 eggs:

"Very little loss; eggs superior.—GEO. H. JEROME."

From N. W. Clark, Northville, Mich., who received 480,000 eggs:

"Last lot of eggs 4 per cent. loss.—N. W. CLARK & Co."

3.—LABOR AND COST OF THE EGGS.

The cost of taking and maturing these eggs was about $8,000. There were 8,170,000 impregnated eggs obtained, making the cost per thousand less than $1.

The following statistics may perhaps be interesting to the curious in such matters as showing what is involved in carrying on this work on so large a scale:

There were in bulk almost 100 bushels of salmon-eggs. To mature these eggs 1,200,000,000 foot-pounds of water were pumped from the river by the wheel-pump. It took 160 bushels of moss from Mount Shasta and over 800 yards of mosquito-bar to pack the eggs. When packed they filled 158 boxes 2 feet square by 6 inches deep. It took 79 crates, containing 2 boxes each, to hold the boxes of eggs. The whole lot of eggs sent East weighed, when packed, 20,000 pounds, and the express charges paid Wells, Fargo & Co. were about $3,000.

In carrying out this enterprise of procuring and shipping salmon-eggs there were the following trades represented by the party at the McCloud River:

1. Painter.
2. Plumber.
3. Blacksmith.
4. Tinman.
5. House-builder.
6. Cook.
7. Laundryman.
8. Seamstress.
9. Bridge-builder.
10. Fisherman.
11. Boat-builder.
12. Draughtsman.
13. Hunter.
14. Fish-culturist.
15. Tailor.
16. Teamster.
17. Gardener.

4.—Summary of results.

The following table presents a summary of the results of the season's work:

Shipped to Massachusetts	80,000
Shipped to Connecticut	480,000
Shipped to Rhode Island	240,000
Shipped to New York	80,000
Shipped to New Jersey	320,000
Shipped to Pennsylvania	480,000
Shipped to Maryland	560,000
Shipped to Virginia	320,000
Shipped to Michigan	800,000
Shipped to Illinois	80,000
Shipped to Wisconsin	80,000
Shipped to Minnesota	400,000
Shipped to Iowa	300,000
Shipped to Colorado	240,000
Shipped to Utah	160,000
Shipped to Canada	80,000
Shipped to New Zealand	50,000
N. W. Clark, for the United States Fish Commission	1,000,000
For the State of California	500,000
Now hatching at this establishment for the Sacramento River and its tributaries	1,750,000
Total impregnated eggs taken	8,000,000

C—TABLES OF TEMPERATURE AND CONDITION OF EGGS.

D—LIST OF NATURAL HISTORY COLLECTIONS.*

450. Salmon Lower Columbia River, Clifton, Oreg. Girth at tail, 6¼ inches; girth front of dorsal, 19¼ inches; length, 27¼ inches; weight, 14½ pounds. *Salmo quinnat;* Indian name, Quinnault. Female: Roe considerably advanced. Eggs about the size of mature trout-eggs. May 8, 1875.

451. Female salmon, Lower Columbia River, Clifton, Oreg. Girth at tail, 7⅝ inches; girth, 22½ inches; length, 36½ inches; weight, 26 pounds.

May 7, 1875. *Salmo quinnat;* Indian name, *Quinnault.* Spawn much more developed than No. 450. Roe nearly a foot long. Eggs nearly as large as Miramichi salmon-eggs when ripe.

452. Willamette River, Oregon City, Oreg. Female salmon. May 17, 1875. See notes on square-tailed salmon. Indian name, *Hwanig.*

453. Salmon, probably a grilse. The Dalles, Columbia River, Oreg., May 14, 1878. Indian names, Silverside, *Uöch*, *Onan.*

454. Same as 452.

455. Same as 453.

456. Lower Columbia River, Oregon. May 18, 1875. Salmon.

457. Trout. McCloud River, California, June 20, 1875.

458. Trout. McCloud River, California, June 21, 1875.

459. Brook-trout. Hunt's Creek, tributary of the Columbia River, Clifton, Oreg. One jar. May 8, 1875.

460. Smelts. One jar. Clifton, Oreg. Columbia River, March, 1874. See notes on smelts.

461. Chubs. Columbia River. Clifton, Oreg., May 9, 1875. One jar.

462. Trout. McCloud River, Cal., June 20, 1875.

463. Same as 462.

464. Same as 462.

465. Same as 462.

473. Same as 462.

474. Same as 462.

475. Same as 462.

476. Male salmon-head, McCloud River, California, September, 1875.

477. Trout, McCloud River, August, 1875.

478. One jar McCloud River specimens containing: (*a*) Bat, October 1, 1875; (*b*) *Wye-dar-deek-it; Salmo spectabilis*, June, 1875; (*c*) two young salmon, September 21, 1875.

* Alcoholic collection made for the Smithsonian Institution.

479. One bottle mud-fish, McCloud River, California, July, 1875.

480. One jar containing: (*a*) one trout, McCloud River, California, summer, 1875; (*b*) teeth *Salmo quinnat*, male, McCloud River, California, September, 1875.

481. Trout fry, McCloud River, California.

482. Skin and head of grilse caught in Merced Lake, near San Francisco, May 28, 1875. This grilse is from one of several thousand eggs taken at the McCloud River, in September, 1873, and afterward hatched and placed in Lake Merced. The grilse was consequently about nineteen months old.

484. One jar *Salmonidæ*, June, 1875, McCloud River, California.

485. One jar *Salmonidæ*, June, 1875, McCloud River, California.

486. Eel, McCloud River, California, September 30, 1875.

XI.—OPERATIONS ON THE McCLOUD RIVER ON SALMON-BREEDING IN 1876.

By Livingston Stone.

A—CONDITION OF THE STATION.

As soon as the condition of the roads permitted last spring, I proceeded to the McCloud River, arriving there on the 16th of March. I was particularly desirous to be at the river as early as possible, because the snows of the preceding winter had been unusually deep on the mountains, and a freshet of extraordinary volume was expected in the streams of Northern California as soon as the influence of the spring sun and rains began to be felt by the snow. The buildings at the United States Salmon-Breeding Station had been located with special reference to the fluctuations of the river, and were all placed above the highest traces of high water, but the winter was one of such unusual severity that I felt considerable alarm, notwithstanding the precautions that had been taken.

Our fears, however, proved to be wholly groundless, at least for this season, for although the Sacramento River, at Sacramento City, was higher than ever before within the experience of white men, and in consequence did a vast deal of damage, the McCloud River did not rise as high as usual. This was owing, without doubt, to the absence of any long-continued rains and the consequent gradual disappearance of the snow from the effect of the sun's heat, only. It was an interesting fact that I might mention here, that during the spring an extremely hot day was always followed during the next day by very roily and usually a lower temperature in the river. This effect was caused, as might be expected, by the melting snows on very hot days, swelling the tributary streams to such an extent as to make them turbid and at the same time colder, and the next morning these results were apparent in the main stream at the fishery, which was 70 miles below the sources of the river. I had left Mr. Myron Green in charge of the fishery during the winter, and I found everything on my arrival in good order. Still there was a good deal to be done in making desirable improvements and in getting ready for the season's work, as, for instance, painting and whitewashing the buildings, constructing fences, getting in the season's supply of fuel and the like, which, thanks to the appropriation made by Congress in the summer of 1876, we were enabled to accomplish.

On the 25th of March there was an eclipse of the sun, and it was a matter of great astonishment to the Indians that we were able to predict the day and hour, and even minute of its occurrence. A considerable number of Indians assembled at the fishery about the time of the expected eclipse, and were extremely pleased with the facility with which they could see the sun through the pieces of smoked glass which I had provided, and through which they watched the progress of the eclipse with great interest and patience. When the eclipse was at its culmination a large otter came out of the water just in front of the house, under the impression, we supposed, that night was approaching.

During their visit we had a good many jokes with the Indians about their theory of the eclipse, which is that a "weemah" or grizzly bear comes and eats up the sun.

B—CONTROVERSY REGARDING OWNERSHIP OF FISHERY.

From this time till the 1st of July nothing specially worth mentioning occurred except the controversy which sprang up between our next neighbor and ourselves concerning the right of fishing at a certain ground on the river.

The facts in the case are these: In the spring and summer of 1872, in the fall of which year I first began work for the United States Fish Commission on the McCloud River, a Mr. Leschinsky and son came over from Shasta to fish for salmon in the river with a seine. They cleared a place for hauling the seine, caught a considerable number of fish at intervals, and returned to Shasta in the fall. The first season, supposing from the representations of Mr. Leschinsky that the fishing-rights belonged to him, I paid him something for the use of the ground, but the next year I ascertained that the fishing-rights on these unsurveyed lands were free to all, and consequently proceeded to draw my seine also on the river without paying any toll for it. This led to a very exciting collision, in which some violence was resorted to on both sides, though no deadly weapons were used. After the first night of my fishing there, no disturbance occurred, and as I had the law on my side no legal complications followed, and Mr. Leschinsky seemed to accept the situation for the time.

On the 9th of December, 1875, however, the President of the United States made a reservation of a tract of land on the McCloud River, including the place where the United States Fish Commission buildings were located, and also the disputed fishery ground.

In the mean time Mr. Leschinsky had entered at the land office a claim to 160 acres of land on the river, also including, as the President's reservation did, the fishery buildings and the fishing-ground in question.

This, of course, opened the controversy afresh on a new basis, and on my arrival at the reservation this spring (1876) Mr. Leschinsky claimed that the land, the fishing-grounds, and fishing-rights all belonged to him, and that the United States Government and its agents had no right to fish there.

Fortified, however, by the President's action in the matter, I proceeded to fish on the fishery-ground as usual, to which Mr. Leschinsky yielded a reluctant compliance, owing to our superior numbers. I was advised to proceed farther and to stop him from fishing within the limits of the reservation, that being now set aside for the exclusive use of the United States. I did not, however, attempt to do this, because that would enable Mr. Leschinsky to bring a personal action against myself and a claim for damages, which was the very thing he wanted to do. This continued for some time, until one evening, when the men went down to fish without me, Mr. Leschinsky told them they could not fish there, and sent them all back again empty-handed, The next evening, taking a sufficient force with me to carry out my purpose, I fished there again, and made known my determination to continue fishing through the season, which resolution I was enabled to carry out, as before, by virtue of superior numbers.

The affair now took the following shape: Mr. Leschinsky could not prevent me from fishing there because he was not strong enough, and I would not prevent him from fishing there because that would lead to a troublesome suit at law. So we both continued to draw our seines over the same fishing-ground, neither interfering with the other, and everything going on very quietly till our dam for obstructing the ascent of the parent salmon was finished and our supply of both for the spawning season began to collect below. Then a new phase of the matter presented itself; and it was this: If Mr. Leschinsky continued to fish, as he actually did, he would obviously catch out all our spawning salmon and we could get no salmon-eggs, and the whole season's work would end in a failure. The spawning season was very near at hand—indeed it was within a week of it—and still as fast as our salmon collected below the dam Mr. Leschinsky caught them out and salted them down or sold them in Shasta. It was now painfully evident that a crisis must be forced or the United States Fish Commission would get very few salmon-eggs on the McCloud this season. Not knowing exactly what to do, I rode over to the nearest point where a copy of the State laws could be found to consult the statute. To my surprise and great gratification I found in the statute a clause making it illegal to extend a seine more than one-third across any river in the State at any time. Of course this disposed of Mr. Leschinsky's case at once. He not only could not reach our spawning salmon now without violating the law, but he had actually incurred a penalty every time he had made a regular haul of the seine all summer.

He was now left no alternative but to stop fishing, which he did immediately, and we had no more trouble in collecting and catching the parent salmon which were to furnish the season's supply of salmon-eggs.

The controversy as to the fishing-rights and the title to the land remains just where it was in the summer. The documents bearing upon it may be found appended to this report. The United States Fish Com-

mission has offered Mr. Leschinsky a fair reimbursement for the labor he has expended on the fishing-ground if he will vacate; but he has declined, and the whole subject has been placed in the hands of the United States Attorney-General, though at the present time nothing has been done toward an adjustment or a legal decision in the matter.

C—BEGINNING OF THE SEASON.

The necessary work having been done to put the place in order for the summer, everything was ready to begin the regular work of the season except the appropriation by Congress providing funds for the season's operations. This appropriation is included in the sundry civil appropriation bill, the passage of which was delayed to a late day. As it was not safe to incur any expense at the fishery till the fate of the fish-culture bill was determined, there was nothing left for us to do but to wait until Congress had taken action in the matter. Week after week passed, however, and the season became so far advanced that at last it became absolutely necessary to begin preparations for the spawning season of the salmon or give up the year's work altogether. It was rather a difficult question to settle. To begin work without the certainty of any appropriation being made to cover the cost was not a desirable thing to do. Neither was it a desirable or agreeable thing to let the year go by without accomplishing anything. Yet one or the other must be done. After a careful consideration of the case, I resolved, if the bill had not passed when the 1st of July came, to wait no longer, but to begin work and take the risk of reimbursement. Accordingly, on the 1st of July, though, as is well known, the sundry civil appropriation bill was still a subject of conference between the two houses of Congress, I began operations at the United States salmon fishery on the McCloud River.

The most important things to be done, were (1) The construction of the bridge and dam across the river to prevent the parent salmon from passing the fishery on their ascent of the river; (2) the placing of a large current-wheel on the river to pump up the water for the hatching-house; and (3) the erection of a new, large, and prominent building for a hatching-house.

I went to work at all of these simultaneously, as there was no time to spare, and the work must be driven ahead at all points, in order to have everything ready for the spawning of the salmon.

The bridge and dam were constructed on exactly the same principles as in previous years, the bridge being formed of heavy timbers resting on hollow triangular piers of logs filled with rocks, and the dam being made of poles resting against the upper side of the bridge. The current is so very powerful on the McCloud, and the volume of water so great, that the building of the bridge and dam is always attended with a good deal of difficulty, but the experience of former years was of great service in accomplishing this labor, and helped very much to

facilitate the work of this year. It helped us also by the use of various expedients to make the dam more salmon-proof than ever before, so that I think it is quite safe to say that, after it was wholly completed, not a single salmon of any considerable size got by it till we allowed them to. The credit of making the dam so secure this year is mainly due to the efforts of Mr. Myron Green, who has been with me in California several years. I ought to add here, perhaps, that the spring rains make such a resistless torrent of this mountain stream, that it carries everything before it, and renders it necessary to build a new bridge and dam every season. The same cause makes it necessary to put up a new current-wheel every year for pumping up the water. In putting up this wheel this season I made some considerable changes. Hitherto the wheel was required merely to lift the water high enough to fill the hatching-troughs on the bar below high-water mark, where the hatching-tents formerly stood. This year, however, as I contemplated placing a new and permanent hatching building above high-water mark, it became necessary, under the proposed arrangement, to lift the water nearly ten feet higher than before. To accomplish this, I erected a 17-foot wheel 40 rods or so farther up the river, where a favorable place was found with a powerful current. The main difficulty here was to place in position the piers for the standards to rest upon, but this being accomplished, the rest of the work of building the wheel and conveying the flume to the site of the hatching-house was easily managed.

The location which I selected for the hatching-house was a flat, just behind our larger main dwelling-house, and about a dozen rods from the wheel. It was so covered with brush and rocks that it appeared at first to be rather an unpromising place for a building, but after being cleared and graded, it proved to be the best spot we could have found for it. The house was built 100 feet long and 24 feet wide. The frame was made of heavy 8-inch timbers, resting on solid posts of oak, and is a very substantial structure. The wheel sends the water through a flume to the filtering-tanks at the upper end of the building, whence it is conveyed in the usual manner to the hatching-troughs. The hatching apparatus is the same used last year, namely, the Williamson troughs, with the deep wire baskets described in last year's report. I ought to add here that the wire basket gave the same perfect satisfaction that they did the year before. They are unquestionably the best thing known for maturing salmon-eggs on a large scale. Of the utmost simplicity in construction, they are more easily handled and will hatch more eggs with less cost, less loss, less room, and less labor than any other hatching apparatus in use.

From the 1st of July, when we began operations, to the 22d of August, when the salmon began to spawn, work was very driving at the fishery, and was sufficient to keep a dozen or more hands employed. Our work crowded us all the more, from the fact that in the middle of July there occurred an exceedingly heated term of nine days, during which the

thermometer recorded an average of 110° in the shade, and about 130° in the sun, where most of the work was going on. This was too trying for the hardiest of our party, and brought them down one after another, till almost our entire camp was converted into a hospital. It was so hot, that in some parts of California birds dropped down dead from the trees and men and horses fell dead in the fields, and it was no wonder that our men could not remain at their work in the sun beyond a limited space at a time, or that nine successive days of this heat put us all on the sick-list. No lasting injury was sustained by any one at the fishery on account of the heat, but the temporary sickness and delay it caused put back our plans somewhat, and made it necessary to push the work the more vigorously when good working days returned.

With the exception, however, of this drawback, occasioned by the heat, things progressed very favorably, and by the time the salmon were ready to spawn the bridge and dam were completed, the wheel was pumping up the water very vigorously, the hatching-house was ready, the roads were put in order for the wagons, the large corral for the spawners was finished, the spawning-shanty erected, and everything ready for the salmon.

It was a very peculiar circumstance, which ought not to pass without mention, that the salmon spawned ten days earlier than they did the year before. The moon was also ten days earlier than it was last year. This opens the subject which scientists scoff at so much in these days, concerning the influence of the moon on terrestrial affairs. Without expressing an opinion on the subject here, I will merely say that from the time of our first arrival on the McCloud the Indians have uniformly said that the salmon would begin spawning with the September moon, and thus far the salmon invariably have.

D—TAKING THE SALMON EGGS.

The first eggs were taken on the 22d of August. They came on very slowly at first; so slowly, indeed, that we began to fear that we should not do more than half a season's work. There were also less fish than usual in the seining-hole below the dam, which added to our discouragement. Our fears, however, proved entirely groundless; for although there were less fish to start with than in previous years, they kept coming up the river steadily every day, and constantly renewed their numbers, so that it was no matter how many we took out on any stated day, there were always as many or more on the fishing-ground the next day. This constant renewing of the supply continued even till we stopped taking the eggs, and I think if it had been necessary we could have taken a third more than we did.

I have adopted the practice now of offering the men a reward, if, in taking the salmon eggs, they will in any one day beat the best day's work done the year before. The reward was offered this year as usual, and I selected the 4th of September as the time for "putting in their

"big day," as they call it. They commenced work as early as possible, and although it rained in torrents all day, they had before night taken and placed in the troughs over a million eggs, beating the "big day" of the previous year by about a hundred thousand, and taking more salmon eggs than were ever taken before in the world in one day. It is true the appended table giving the daily returns of eggs states 930,000 as the number taken on September 4, but this is because in placing the eggs in the troughs we undercount by about 10 per cent. to allow for waste, and to make sure of having full measure when the eggs are packed to send off. Any one who has had much to do with handling fish-eggs will appreciate the value of this precaution. By the 8th of September we had enough eggs for distribution in this country, and consequently stopped taking on that day, though I made arrangements for taking another lot on the 16th and 17th of September for New Zealand, it being necessary to take the New Zealand eggs on those days in order to have them of just the right age to ship by the Australian steamer, which was to sail from San Francisco on the 10th of October. On these two days we took 630,300 more, making 7,498,500 in all, according to our count, which, as before mentioned, was considerably below the actual number.

In the actual process of taking the eggs we made some improvements over previous years, the chief of which were securing a uniformity of temperature for the eggs in their earlier development, and a greater regularity in the time of attending to the various manipulations of the eggs. To accomplish these results two long troughs were placed in the spawning-shanty, with compartments just large enough for admitting one spawning-pan in each, and a clock was hung upon the wall. The trough was kept filled with fresh water from the river, which thus insured an even temperature for all the pans which were placed in it. As soon as a pan of eggs was taken, the time was noted and recorded, and exactly four minutes afterward the water was added to the pan, and in exactly an hour the eggs were washed and sent to the hatching-house. The result of this case showed a great improvement in the vitality of the eggs, the loss in taking them being much less than in previous years.

I tried another innovation this year, which perhaps deserves the name of an improvement, and which consisted in taking a pailful of eggs at a time. For instance, a half dozen men would be ready with their spawning-fish, and would, as rapidly as possible, take the eggs of all their fish in one pail. If everything is ready, so that there is no delay, five or six fish can be spawned in this way with safety. By this method the eggs can be taken in larger bulk, and perhaps some time can be saved by it, though I do not consider it a very great improvement over the old plan of taking the eggs of one fish in each pan, which is a pretty satisfactory way after all.

During the first few days of the spawning season, while we were in

doubt whether there would be enough parent fish to supply the required amount of eggs, I detailed a number of men to go down the river below the fishing-grounds and drive the salmon out of the holes and off the rapids, where they had collected, with the hope that they would ascend the river to the seining-grounds and increase the supply of spawning-fish. The ruse was very successful, and every day's work at scaring out the salmon below resulted in a very perceptible increase of spawners at the fishing-ground. This led to the idea that it would a desirable thing to clear a second fishing-ground below the present one, and to work the new one in connection with the old one, the effect of which would be to cause the fish to collect on one ground while the fishing was going on at the other, which would of course very much facilitate the capturing of the parent salmon. This idea presented itself to me with so much force and so favorably that I immediately set at work to carry it into execution. The place selected as the most favorable for the purpose was the first large hole below the old fishing-ground, and about eighty rods distant from it. I put five or six men upon the job of clearing this ground with a Spanish windlass and two cables of inch and $\frac{3}{4}$-inch rope each; but so ponderous and obstinate were the snags and logs which had to be removed, that, after a week's work, almost the only results were two parted cables and a half a dozen swollen heads and bruised limbs, the effect of accidents in working this powerful windlass against so much resistance. This undertaking, however, was not abandoned, and before the fishery was closed for the season the new fishing-ground was tolerably well cleared, and in a condition, I think, to be safely swept with the seine next spring. This labor, although it has cost severe and dangerous exertion and a good deal of money, will, I hope, be worth in future seasons all it has cost.

The eggs having been secured, the next thing was to find help to take care of them. In the northern Atlantic States, where the salmon eggs are two or three months maturing for shipment, as at the Penobscot River station in Maine, it is not such a great labor to look after the eggs and pick out the dead ones; but in California, where the whole year's supply, say seven or eight millions, mature in less than twenty days, it is a work that requires a great deal of attention and a great many hands. The best help for doing this I have found to be the more careful class of Indian women. These women, accustomed to patient and monotonous labor, are unusually adapted to the work and give excellent satisfaction. Many, especially the younger and more frivolous ones, I have found it necessary to discharge, but there are some who work faithfully and patiently at it, whose work could not be surpassed. The patient habits which their native education has given them, together with their dexterity and delicacy of touch, especially fit them for this kind of labor.

E—THE SHIPMENT OF EGGS AND HATCHING THE SURPLUS.

So short is the time at the McCloud station between taking the eggs and shipping them, that they were hardly in the hatching-troughs before we were preparing to pack and send them off. As is well known to those who have kept track of the labor of the United States Fish Commission on the McCloud River, the only available moss for packing the salmon-eggs is found in the spring-brooks which head in Mount Shasta. This moss is not by any means abundant, and the extensive draught which we have made on the supply for the last five years has so reduced it that this year we had to go seven miles farther than usual in order to get enough for our purposes. It has always been a good deal of an undertaking to collect the moss, and from the cause just mentioned was made still more so this year. I obtained a large quantity, however, but still not quite enough to pack the eggs with. The deficiency was supplied by the river moss, as we call it there, which is found on the rocks on the river-banks in shady places, anywhere very near the water. In ordinarily dry seasons this is not available, as it is dried up and worthless; but this year, fortunately, there was so much rain during the summer that we were able to find a very considerable quantity of it which was suitable for packing.

Hitherto the salmon-eggs have always been sent to their eastern destination by express. The suggestion has often presented itself, however, that they might possibly be shipped at a much less expense by means of a car provided with a sufficient complement of ice, and taken along with the overland express trains. Notwithstanding the many difficulties that stood in the way of carrying out this suggestion, I nevertheless decided to attempt the undertaking, and accordingly arranged with the Central Pacific Railroad Company to have a large fruit-car at Redding, our nearest railway station, on the 21st of September, loaded with four tons of ice. On the same day that the car arrived at Redding we commenced packing the eggs at the McCloud Fishery. Strange as it now seems, it was once considered a good day's work to pack and ship 80,000 eggs in a day, as Mr. Atkins, of the Penobscot Salmon Breeding Station, can testify; but my men, by long experience in their work, had acquired such dexterity and method, that on the first morning we packed four hundred thousand eggs in an hour and a half. One of the dangers of not making the refrigerator car a success was the supposed impracticability of packing a full load for a car in a sufficiently short space of time. For instance, at the rate of 80,000 a day, it would take fifty days to pack 4,000,000, in the course of which all of them would not only be hatched, but would be ready to feed. The extraordinary dispatch with which our first lot of eggs was packed removed all doubts concerning our ability to get a full car-load packed within the required time.

During the rest of the week, however, we continued packing the eggs as they were required, sending three or four wagon-loads each day to the car at Redding, where Mr. Green was detailed to superintend the

loading into the car. The last wagons left the Fishery on Sunday noon, September 24. At midnight of Sunday the eggs were all in the car and everything ready for a start. Soon after this the car was attached to the train, and the salmon-eggs were on their way to their distant destinations. Thinking that, as this was the first experiment in transporting the eggs in a refrigerator-car, it was more important that I should go with them than to remain at the fishery, I accompanied the train that took the car.

No one who has not gone on such an expedition can know the amount of trouble that conductors and other railroad officials can cause a man who has charge of it. But without enlarging on this topic, which might, however, be made to fill a small book, I will say that at Sacramento, where I received every attention from the Central Pacific officials, I took on four more tons of ice, which was furnished by the Pacific Ice Company at half their usual rates, and I left on the eastern-bound train for Chicago at 3 p. m. on the 25th of September. Although extremely hot at Sacramento, the air soon became cooler as we ascended the Sierra Nevada. The ice in the car kept the eggs cool, and lasted till my arrival at Chicago. We arrived here with the eggs in fine order at 3.45 in the afternoon of Saturday, September 30. This being the most convenient distributing point for the eggs, I left the car at Chicago and forwarded the eggs from there by express. I had previously telegraphed to the United States Express Company to meet the car on arrival with men, teams, and ice, for receiving the crates of eggs and forwarding them on the 5.15 p. m. trains east.

I take pleasure in saying that the United States Express Company was fully up to the emergency, and although there was only an hour and a half to spare, most of the eastern-bound eggs were started on their journey that afternoon.

Unfortunately, from unforeseen circumstances, a portion of the eggs had to stay in Chicago till the next Monday evening, when they also were shipped to their destinations. The two days that the eggs were at Chicago were, however, fortunately, very cold, and they suffered no damage, and all arrived at their destinations in surprisingly good order, as will be seen by reference to the table *b*, which gives the number, destination, and condition on arrival of each consignment.

The work at the McCloud Fishery was left on my departure in charge of Mr. Myron Green. This was no trifling responsibility, as it involved the shipping of the New Zealand eggs, and the balance due at eastern points, the taking to pieces of the bridge and dam, the shoring up of the piers for the winter, the general packing up and getting ready for the rainy season, the hatching and distributing of nearly 2,000,000 salmon for the State of California, and various other work. Everything, however, appears to have been well attended to.

The California eggs were hatched out in fine condition. On the 7th and 8th of October the New Zealand and Sandwich Island eggs, to the

number of 400,000, were sent to the Australian steamer, and the remaining eggs for destinations in this country were forwarded. The bridge was taken to pieces, the piers were shored up for the winter, and the other work was going on well when a disaster occurred which it was not within the scope of human foresight to avoid. A terrible storm of rain came on, the river rose to an unnatural height for this season of the year, and with the tremendous force which it acquired when swollen, it swept away the splendid 17-foot wheel, foundations and all, which pumps up the water into the hatching-house. There was no avoiding this calamity. It was necessary to keep the wheel in its place at this period, in order to supply water to the immense number of young salmon in the hatching-house, and no human power could hold it there against the almost irresistible force of the McCloud River at its height. The wheel, as I said, was torn to pieces, with its solid foundations, and swept down the river. Before the absence of the water was felt, however, by the young salmon in the hatching-house, Mr. Green removed them to the river and saved them. It was the wish and the intention of the California fish commission, who paid for the hatching of the fish, to have them kept in the hatching-house till they were more mature; but I think I shall find indorsement from most fish-culturists when I say that the young fish are about as safe when they are placed in the turbid waters of a freshet, where they cannot be seen by the larger fish that prey upon them till they have hidden themselves under rocks and snags, as they are when they are placed at a more advanced stage in the clear water of the river, with the disadvantage of having lost a large part of their natural caution and shyness from having lived so long in the artificial troughs in absolute freedom from all their natural enemies. When the wheel is rebuilt, I am inclined to think that it will be better to support it on boats that will rise and fall with the water than on stationary piers. Lumber costs so much in that section that it will be rather an expensive undertaking, but will be an economical one, I think, in the long run, especially as this plan will secure irrigation of the ground about the buildings all the year round, and pave the way for a vineyard, fruit-orchard, and vegetable garden at the fishery in subsequent years.

F—FOREIGN DEMAND FOR SALMON-EGGS.

The foreign demand for salmon-eggs from the McCloud Fishery promises to be a marked peculiarity of this station in the immediate future. Australia, New Zealand, the Sandwich Islands, and South America have appeared as applicants for eggs from this source. It is true Australia had received all its salmon-ova before last year from Great Britain, but the shipments from that country have been so expensive and so hazardous, and have been attended with such disastrous results that in future the Australians will, without doubt, look for their supply of salmon-eggs to California, which furnishes a source of supply so much nearer home. This is more likely to occur because a consignment of eggs from the

McCloud River, sent by the United States Fish Commission last year, and intended for New Zealand, having been left in Australia for want of sufficient ice to take them to their destination, opened in good order, were hatched out by the Australians, and the young salmon placed successfully in the Australian rivers. New Zealand applied for a few hundred thousand this year, but will probably want next year nearly as many millions. The Sandwich Islands have begun with 30,000 eggs, but will, without doubt, increase their application in future to hundreds of thousands. No eggs have yet been sent to South America, but the government of Chili has expressed a desire for some, and as soon as the political disturbances there admit of moving in this direction a large number of salmon-eggs will probably be wanted for Chili. To illustrate the changes that have taken place in the last few years in the world's supply of salmon-eggs, I will mention the striking fact that five years ago the United States paid the Canadians $40 a thousand, in gold, for salmon-eggs, and now the United States Fish Commission is sending salmon-eggs from California to the British colonies of the Pacific for 50 cents a thousand, being a reduction of price in the ratio of 80 to 1.

G—THE ESTABLISHMENT OF NEW STATIONS.

Salmon-breeding on the Pacific coast has, up to this time, been confined to the McCloud River station, in Shasta County, California, but it is quite possible that the United States Fish Commission will be required to enlarge its sphere of usefulness on this coast and establish branch stations for salmon-breeding both on the San Joaquin River and the Columbia River. A station on the San Joaquin seems to be called for, because we now know from actual observations that the San Joaquin salmon, in ascending the river to spawn, go through water having a very high temperature compared with all other known salmon rivers in the world. This has led to the very reasonable supposition that San Joaquin salmon may be made to flourish in the Atlantic rivers of the Southern States, which have hitherto contained no fish of the salmon family. The mere possibility of such an important result being attainable seems to make it worth while to operate on the San Joaquin River in obtaining salmon-ova, at least long enough to stock some of the Southern Atlantic rivers, and fairly test the question whether this variety of salmon can be made to live and thrive there. I would strongly recommend that the attempt be made as soon as circumstances permit.

On the Columbia River, a salmon-breeding station is called for to enable the river to sustain the enormous draughts which are made upon its salmon-supply by the canneries established on that river. It is estimated that 40,000,000 pounds of salmon were canned or cured on the Columbia this season (1876). It will, indeed, be a wonderful river if it can stand an annual draught on its resources of this magnitude. The general anticipation is that the river, prolific as it is in salmon, will not be equal to the occasion, and that artificial propagation must be resorted

to to keep up the supply. It is more than probable that this will be done, in which event it is likely that the funds will be provided by contributions from the canning-companies on the river, and that the work will be done by the United States Fish Commission. It will be seen by the tables appended to this report that the work of the United States Fish Commission this year on the McCloud River in California has been very successful. It has been, also, without doubt, every year a great public service. It depends, it is true, for its continuance on appropriations made by Congress, but every thousand dollars expended by the people in this work is returned to them tenfold, or, perhaps, one-hundred-fold, in the increase of the food-fishes of the country.

H—TABLES EXHIBITING THE WORK AND OBSERVATIONS.

To illustrate what has been done at the McCloud station by the United States Fish Commission, I give below a tabular statement of the daily number of salmon-eggs taken at the fishery for the last three seasons:

TABLE I.—*Daily record of salmon-eggs taken at the United States salmon-breeding establishment, McCloud River, Redding, California*, 1874, 1875, 1876.

TABLE II.—*Statement of salmon-eggs distributed from the United States salmon-breeding station in California during the season of* 1876.

Date of shipment.	Consignee.	Number of eggs.	Condition on arrival as reported by the parties receiving the eggs.
1876.			
Sept. 21	Professor Baird, Centennial Grounds, Philadelphia, Pa.	5,000	"Fair."
24	State Hatching-House, Madison, Wis	100,000	"Came nicely."
24	Dr. W. A. Pratt, Elgin, Ill	150,000	Not heard from.
24	A. P. Rockwood, Salt Lake City, Utah	50,000	"Nine-tenths of 1 per cent. loss."
24	Lewis C. Starkel, Belleville, Ill	100,000	"In excellent order."
24	F. N. Clark, Northville, Mich	500,000	"Two and one-quarter per cent. dead."
24	Pack Thomas, Louisville, Ky	200,000	"Two and three-quarters per cent. dead."
24	T. B. Ferguson, Baltimore, Md	1,000,000	"Better condition than last year."
24	Dr. R. O. Sweeny, Saint Paul, Minn	300,000	"In fine condition."
24	E. M. Lees, Westport, Conn	500,000	"Less than 2 per cent. dead."
24	James Duffy, Marietta, Pa	400,000	"In fine condition; very slight loss."
24	E. A. Brackett, Winchester, Mass	200,000	"In good condition."
24	S. P. Thompson, New Hope, Bucks County, Pa.	100,000	"Splendid order; less than 2 per cent. loss."
24	M. S. Rodgers, Knoxville, Tenn	100,000	"Less than 1 per cent. loss."
24	S. Wilmot, Ontario, Canada	10,000	Not heard from.
24	New York Aquarium, Thirty-fifth street and Broadway, New York.	50,000	"Fair condition."
24	Boston Aquarium, 13 West street, Boston, Mass.	10,000	"Arrived in the best condition."
24	Professor Baird, Centennial Grounds, Philadelphia, Pa.	10,000	"In good order."
27	Sportsman's Club, San Francisco, Cal	300,000	"In fine order."
Oct. 2	W. H. Cushman, Georgetown, Cal	300,000	Not heard from.

I—RESERVATION OF THE McCLOUD RIVER FISHERY BY THE PRESIDENT.

DEPARTMENT OF THE INTERIOR,
Washington, D. C., Dec. 7, 1875.

SIR: I have the honor to recommend the reservation, for pisciculture, of the smallest legal subdivision within which the premises on the McCloud River, California, represented on the diagram herewith inclosed, shall be found to be embraced when the lines of public surveys shall have been extended over the same.

This request is made at the instance of Professor Spencer F. Baird, Commissioner, under the act of February 9, 1871, (16 Stat., 594;) and the Commissioner of the General Land Office informs me that the records of his office present no objection to the reservation.

I am, sir, very respectfully, your obedient servant,

Z. CHANDLER.

The PRESIDENT.

EXECUTIVE DEPARTMENT, *Dec.* 9, 1875.

Let the tract of land described within be reserved for pisciculture, as recommended by the Secretary of the Interior.

U. S. GRANT.

DEPARTMENT OF THE INTERIOR,
GENERAL LAND OFFICE,
Washington, D. C., August 5, 1876.

SIR: I have the honor to acknowledge the receipt of your letter of 22d ultimo; also the receipt, by reference from Professor Milner of the Smithsonian Institution, of your letter to him dated 3d instant, and letter dated July 25th, ultimo, addressed to you from Livingston Stone, informing this office that one A. Leschinsky claims rights of fishing on the reservation made by executive order dated December 9, 1876, for pisciculture purposes, on the McCloud River, in the State of California, and suggesting that this office issue a peremptory order to Mr. Leschinsky to vacate the premises covered by said reservation. In reply I have to inform you that it is not the province of this office to issue any order in the premises, but I would call your attention to the following section of the United States Revised Statutes bearing upon the subject:

By section 2258 it is provided that lands included in any reservation by any treaty, law, or *proclamation by the President*, shall not be subject to the rights of pre-emption.

Also, by an act of Congress approved March 3, 1853, (U. S. Stat., vol. 10, p. 246,) it is declared that all public lands in that State shall be subject to pre-emption, but with this general exception, to wit, *lands reserved by competent authority.*

Section 12 of the same act also excludes from disposal certain lands, viz, mineral, or lands *reserved for any public purposes whatever.*

It appears from your letter of 3d instant that Mr. Leschinsky was on the ground fishing prior to its occupation as a reserve. This being the case, he may have equitable rights to the lands he occupies, of which this office has no knowledge whatever, and which could not be considered by this Department. Even if he claims by pre-emption, no vested rights accrue as against the United States until proper proof and payment for the land has been made. (See Hutchins *vs.* Low, 15 Wall. Reports, p. 77, and other cases there cited.)

It thus appears that Mr. Leschinsky can have no legal rights to any of the lands within this reserve, and in case he persists in occupying the same or in interfering with the operations of the fisheries, I would suggest that you make application to the Department of Justice to have him ejected therefrom.

Very respectfully, your obedient servant,

J. A. WILLIAMSON,
Commissioner.

HON. SPENCER F. BAIRD,
United States Commissioner of Fish and Fisheries,
West Philadelphia, Pa.

DEPARTMENT OF JUSTICE,
Washington, August 15, 1876.

SIR: Replying to your letter of 11th instant, I have to inform you that I have this day instructed John M. Coghlan, esq., United States attorney for the district of California, to investigate and ascertain the facts of the case you present to me, and, if he shall find that one A. Leschinsky is unlawfully occupying and claiming a right of fishing upon the McCloud River, and interfering with the works which Mr. Livingston Stone has in charge, to take the proper steps to eject him from the reservation; or if that shall be deemed unnecessary, to take such other course as, upon consultation between him and Mr. Stone, shall be deemed expedient.

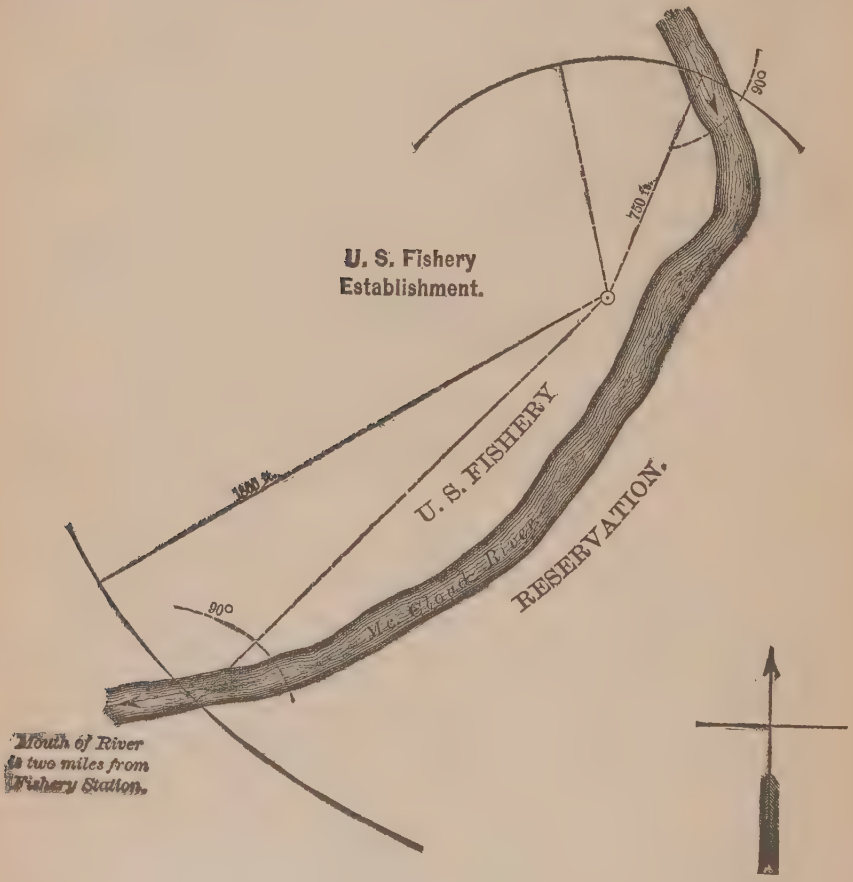
Very respectfully,

ALPHONSO TAFT,
Attorney-General.

Hon. SPENCER F. BAIRD,
United States Commissioner of Fisheries,
Washington, D. C.

APPENDIX.

The following diagram represents the extent of the United States salmon fishery reservation on the McCloud River, as established by the United States General Land-Office, upon the proclamation of the President:



XII.—CORRESPONDENCE RELATING TO THE EXPORTATION OF FISHES AND FISH-HATCHING APPARATUS TO NEW ZEALAND, GERMANY, ETC.

A—THE SHIPMENTS MADE IN 1875 TO NEW ZEALAND.

SAN FRANCISCO, *August* 21, 1875.

DEAR SIR: Would you be so kind as to furnish the Province of New Zealand with 50,000 impregnated salmon ova from the McCloud River fishery for transportation per steamer?

Yours, respectfully,

CHAS. KAEDING.

Hon. SPENCER F. BAIRD,
United States Fish Commissioner, Washington, D. C.

The following details refer to the distribution of and progress made with the California salmon eggs sent to New Zealand from the United States salmon hatchery establishment in 1875, and will be found exceedingly interesting.

DISTRIBUTION OF THE SALMON OVA.

To the Editor of the Herald:

SIR: Many persons having asked me to publish an account of the results of my expedition to place California salmon ova in the rivers of the Thames and Waikato country, on behalf of the Auckland Acclimatization Society, I forward you a copy of a letter I have addressed to a sporting friend of mine in England. I hope your readers will be good enough to excuse the somewhat familiar style of the communication, as I have not leisure to write an account perhaps more suitable for a newspaper.

I am, &c.,

J. C. FIRTH.

AUCKLAND, *November* 19, 1875.

MY DEAR C——: Let me give you a rough sketch of an expedition I have just made to place salmon ova in some of the headwaters of four of our chief rivers in this part of New Zealand. You will perhaps be more interested when I tell you that in this colony there is a remarkable absence of plants, animals, or fish natural to the country suitable for the food of man. To remedy this deficiency in some measure, we started some years ago an Acclimatization Society, whose object is to intro-

duce useful plants, animals, birds, and fishes. Our society was greatly encouraged by the success which had attended the efforts of one of our worthy citizens, Mr. Thomas Henderson, to introduce the pheasant. Thanks to him, this noble bird has covered the country, and we can give you, and all sportsmen who may come this way, almost as good shooting as you can get in your preserves at home. You would be delighted to see so many of your old favorites, which we have introduced with great success—the finches, linnets, blackbirds, yellowhammers, buntings, the unjustly abused house-sparrow, and, above all, that most charming of English song-birds, the sky-lark. Latterly our society has turned its attention to the introduction of trout and salmon—both brown trout and salmon-trout are promising to succeed—and in a few years I hope to see the disciples of gentle old Izaak Walton having many a good day's sport. Hitherto our efforts to introduce salmon have been total failures. About a week ago, however, fortune favored us. It happened in this wise: The mail-steamer Vasco de Gama arrived with 40,000 salmon ova for the Acclimatization Society at Napier. Unfortunately the supply of ice had run out, and the gentleman in charge, fearing a total loss if the ova were sent on, kindly and wisely, as it has turned out, offered us half the consignment. Late one night our curator called at my house and informed me of the state of affairs, and we immediately placed 10,000 of the ova in our fish-house to be hatched. The remaining 10,000 we could not accommodate. I proposed to place them in some of the southern rivers in this province, but as none of the council could go, or, perhaps, knew the rivers so well as myself, I volunteered to see the work done. Not an hour was to be lost when I took it in hand. I had some ice made at once, and setting Tremain, one of my workmen, to make the necessary appliances, in a very short time I was off with my precious cargo. The railway and a river steamer put me 100 miles south in a few hours. I had telegraphed to a sporting friend to have his trap ready, and next morning we started bright and early for the mountain streams. Fortunately the weather turned bitterly cold, and by dint of constant attention and an abundant use of ice and cold water, I kept the ova in the primest and healthiest condition. Besides my sporting friend, Mr. R. Kirkwood, I had requested my manager at Matamata, Mr. Williams, and Mr. Chitty, of the armed constabulary, to be ready to lend a hand. This latter gentleman, besides being a true sportsman, is a most excellent officer, whom I hope to see shortly get the promotion he well merits. Besides these, I had pressed into the service O'Neill, an A. C., well up in salmon, Bob, one of my own Maoris, and Turner, a fine specimen of the half-caste. My little party were a hearty lot, and went at it *con amore*. We had two days' real hard work, but very pleasant nevertheless. Up in the morning early, with the help of good horse-flesh, cushions of elastic fern to prevent vibration, ice, water, and bundles of fern to keep out the heat, we conveyed our ova over long distances and rough roads as tenderly as though we

were conveying delicate children. Fortunately, the sun considerately kept well behind the clouds, whilst the bright moonlight of the clear, cold nights served us admirably. During these two days and nights, with two meals a day, and very little time for sleep—though what we had was sound enough, as you may fancy—we got through an amount of work which pleased me greatly. Nothing could be finer than the *esprit* of the whole party. I do not know when I enjoyed anything more. The enemies we had to fear were wild ducks, shags, and eels. The apparatus I had provided to defend our little *protégés* from their attacks was very simple, and I hope may be effective. It consisted of twelve sets of boxes and covers, boxes three feet long and nine inches broad, with a ledge running round each. The covers were of two boards same length, nailed together, ridge-board fashion, with each end closed by wire netting of half-inch mesh. A keen sportsman like you will not think me tedious if I describe how we made our plants. The streams were high and the water intensely cold. Taking off our boots and coats, rolling up our trousers and shirt-sleeves, Kirkwood made a smooth bottom and spread some sand and pebbles in the box, while I prepared the ova, which is like semi-transparent red pease. Scattering the ova among the sand and pebbles in the box, I held it on the bottom of the stream at about two feet deep, to provide against the stream falling and leaving our plant high and dry, which, of course, would have ruined the whole thing. Kirkwood had the cover ready, and placing it firmly on the box, I held it down, while he piled over it heavy bowlders to keep it in position. Both now set to work to make a little breakwater of bowlders and shingle up stream, to defend our little ark from the rapid current, and, scattering a further supply of ova among the shingle to give a double chance to the experiment, the operation was complete. In one stream we had a great fright. We had just got the ark into position, I holding it firmly down, while Kirkwood was piling bowlders over it, when he suddenly called out, "Here's a big trout, a regular monster." I could not let go, as the whole thing would have been adrift. "Nonsense," said I; "why, I only put salmon trout into this stream a year ago, and they can't have developed into monsters already." "Look for yourself, then," he roared out, and sure enough there *was* a monster, but, instead of a trout, a black, hideous eel, four feet long, rubbing his slippery sides against Bob's naked legs, and waiting, like a *gobe-mouche*, for our poor little ova. "Seize him, Bob," I shouted; "grab him behind the fins." This he did in a twinkling, but the ugly reptile glided out of his hands, like a slippery eel as he was, and we saw him no more—giving me a proof of the value of the little arks I had provided for the ova. I didn't feel easy about the eel, however, until at night, on relating the circumstance, Chitty declared his days were numbered, for he would have him next night. I hope he got him. Some of the points we chose were charming. One took my fancy particularly. We had started before breakfast, and after a drive and a tedious tramp on foot, we reached the stream. We had completed our preparations, and in two minutes more

our *plant* would have been made, when a loud voice in broad Scotch hailed me with "Hey, mon, ye mauna pit the sawmon in there; that place is foo o' eels; the Maori chiels catch bushels o' 'em." Looking up, I said, "My good man, what do you know about salmon?" "Eh, mon, I cam frae Blair Athol, an' I ken a' aboot sawmon; dinna pit 'em there. I can show ye a muckle better spot. Come wi' me and I'll show it the noo." The old man was so earnest that, though I was anxious to put them under the water without delay—for the sun on this last morning was coming out hot and our ice had just run out—that I at once put up my ova and told the old man to lead the way to a better place. Slowly we toiled up the hill, carrying our traps as best we could, and mounting our trap, our conductor taking a short cut. When the trap could go no farther, we alighted, and trudged after him in the broiling sun. At length I began to feel hungry and angry, for I feared the ova would hatch before I could get them under water. "Bide a wee, bide a wee, mon, yonner it is." There was nothing for it but to keep moving. At last he led us down to the stream—and a very charming spot it was. "Ah, now," said I, "I shall forgive you," for I felt the old man knew the ground better than I. We quickly and joyfully made our plant, and sitting down on a huge moss-grown rock in mid-stream, round which the clear cold water rippled and dashed with sweet and cheery music, I could not help saying to my companion, "What rare sport some of those who come after us will have in this glorious spot, if our little friends do their duty and grow into big fishes." I am no sportsman, but had I been an artist, I would have sketched the scene with myself and Bob sitting on the grey old stone with our legs dangling in the clear cold water as it rippled by. Gathering up our traps we turned joyfully homewards, for we noticed that the ova were already hatching, coming out of their shell as we put them in the water. The King Maoris, and indeed everybody, were delighted with our work—the former greeting us with "Kapai te hamona; all the same as the tin"—meaning, that salmon was very good, being like the salmon preserved in tins, which they appreciate highly. I ought to say that at every stream where I made a plant, I posted up a notice in Maori and English, requesting every one not to disturb the ova, so that in a few years there might be abundance of food for both Maori and European. And now our work was done. We had been enabled to place this salmon ova in ten streams falling into the rivers Thames, Piako, Waikato, and Waipa, in the hope that, by God's blessing, these "king of fishes" may, in coming time, increase and multiply, so that abundance of food may be provided for poor as well as rich, for—

All things living he doth feed,
His full hand supplies their need.

Pardon this long, but I hope not tiresome story, and believe me,

Yours, truly,

J. C. FIRTH.

AUCKLAND, N. Z., *November* 16, 1875.

SAN FRANCISCO, *January* 25, 1876.

DEAR SIR: By the City of Melbourne I am acquainted that a small lot of ova that went to New Zealand by that boat, some four months since, did not land well. A gentleman in Otago, N. Z., who has been very successful in fish-hatching, had the care of a case of ova taken by the City of Melbourne, and he acquainted me that he found every one hatched and dead some days before he received them in Dunedin. Some that went to Auckland reached there safely, but the proportion was small. My informant thinks that the ova must at latest leave here by the middle of September. I am further informed that by next season he hopes to make a trial, and that probably he will be joined by the acclimatization societies of Timaru and Christchurch, N. Z.

Last month the secretary of the province of New Zealand passed through here on his way to New Zealand, and I gave him a note of the correspondence from you. On reaching New Zealand the matter will be put before Sir Julius Vogel, and I am in hopes that next season may find the matter taken in hand by the New Zealand Government. My correspondent from Dunedin says he understands there is a valuable work published in the States on fish-breeding, but does not know the author. Do you think it would be that of Mr. Baird?

I am yours, faithfully,

J. W. DUNCAN.

LIVINGSTON STONE, Esq.,
McCloud River, Redding.

Please address letter to me in future, P. O. Box 204.

B—SHIPMENTS OF FISH-OVA IN 1876 TO NEW ZEALAND.

DUFF & CO., COMMISSION MERCHANTS,
316 *Davis street, San Francisco, May* 19, 1876.

DEAR SIR: Last year by the kind assistance of my friend Mr. Kaeding, I was fortunate enough to obtain from your establishment 50,000 salmon ova, which I shipped to New Zealand, intending them for the province of Napier. The steamer taking them from here touched only at Auckland, and as no ice could be procured there, Mr. Ormond, superintendent of the province of Napier, donated one box to the Acclimatization Society at Auckland, and ordered the other forwarded to Napier, expecting that by extra care they could be safely kept for three days, the usual time of coasting-steamer between the two ports. Unfortunately, in consequence of bad weather, the small steamer was two weeks on the passage, and the ova became totally lost. In a letter received from Mr. Ormond, per steamer Zealandia, he says, "Will you be kind enough to convey our acknowledgments to the gentlemen who superintended the packing of the ova received? Nothing could be better than the

manner in which it was packed, and the box opened at Auckland was in splendid order, although the supply of ice had run out some days before the big steamer reached that port. You will be glad to hear that the ova left at Auckland succeeded admirably, and that in fact it has started, and started *well* salmon in the Auckland rivers. Now, Auckland climate is warmer than at Hawkes Bay, and they have not the same facilities for hatching ova; also their rivers are not as suitable as ours, which are fed by water from snowy ranges. Seeing all this, I am quite confident that if we can get another shipment from the same source as the last we shall succeed thoroughly, as the California mail service, now that the new line is getting gradually into working order, gives great facilities for getting the ova safely to Napier."

As my friend, Mr. Kaeding, is now in Europe, I write to ask if I can procure from your establishment a duplicate of last year's shipment—say 50,000 ova. I write thus soon because I understood from Mr. K. that permission had to be obtained from Washington, and it might, perhaps, save some trouble to make the application in time. As soon as I know what amount it is necessary to send you or pay here, I will at once attend to *that* on receipt of advices from you.

I remain, yours, respectfully,

ROBT. P. R. DUFF.

LIVINGSTON STONE, Esq.,
McCloud River.

WELLINGTON, *June* 23, 1876.

SIR: Understanding from you that it is the intention of the Canterbury Acclimatization Society, to send for fish ova to America, by the outgoing mail, and that it is desirable that the society should be furnished with an official record of the fact that the society is acting in accord with the provincial government of Canterbury, I have the honor to inform you that you are authorized to state to Mr. Livingston Stone, who, I understand, is a representative of the United States Government in this matter, that the society is acting and expending money for the provincial government of Canterbury in the arrangements which it is making for the introduction of fish into the New Zealand rivers, and that, in conjunction with the similar society in the province of Auckland, it will have a sum of money placed at its disposal for expenditure upon this purpose.

It is gratifying to learn that we may expect the co-operation of the United States Government, in the promotion of an undertaking of such large importance to this colony.

I have the honor to be, sir, your obedient servant,

WM. BOLLISTON,
Superintendent of Province of Canterbury.

D. CAMPBELL, Esq.,
M. R. C. S., &c.

AUCKLAND, *July* 1, 1876.

GENTLEMEN: I think I stated in my last letter of May 8, that we had decided to import a consignment of salmon ova during the approaching season, and we were only waiting to ascertain whether the southern societies would unite with us in the undertaking. As the Canterbury and Waryanni societies have both agreed to do this, we have decided to introduce 250,000 ova; and the inclosed letter to Mr. Livingston Stone (which perhaps you will kindly forward) contains an order for that number.

I hardly suppose I need say anything about the packing of the ova, for Mr. Livingston Stone will doubtless see that this is properly and efficiently done. I have no doubt but that arrangements can also be made with him for delivering the ova at San Francisco, and for which you will kindly reimburse the cost to him.

The point that will demand the most attention is that the boxes of ova are safely placed on board the steamer in a good and sound ice-house, packed so as not to be jolted about, and furnished with an ample supply of ice to last the whole voyage. Under the circumstances it would be better to have a special ice-house built on deck. Mr. Stone will be able to give you some valuable hints, as to the form and construction of this. My own opinion is in favor of one with double walls and double roof, the interspace of, say, six inches being filled with sawdust which is a bad conductor of heat. Inside the ice-house the boxes should be packed so as not to be disturbed by the rolling of the vessel, and so arranged that a space is left for a free current of air around them and between each box. The ice you can place in a manner that appears best adapted to keeping the whole of the ova at a temperature below the freezing point.

By all means provide plenty of ice, as if that fails for a single day the whole consignment would be probably lost. It would be far better to have a ton or two of ice to spare on arriving here than to risk the safety of the entire shipment.

Most likely it will be advisable to engage some one on board the steamer to look after the consignment, giving him a small payment for the voyage, and promising him a gratuity of £20 if the ova be landed here to my satisfaction as to condition of ova and supply of ice. Of course so long as affairs appear to be all right it would be injudicious to enter the ice-house; but contingencies might arise (such as the displacement of some of the ice, or even the boxes, by a storm) which would render the presence of some one, previously instructed, of great value. It might be advisable to have two small windows six inches square on opposite sides of the ice-house. These windows must be double; that is, one pane of glass on the inner wall and one pane on the outer wall—both being made air-tight.

It would oblige me if you would mention to Mr. Stone, if opportunity occurs, the importance of forwarding the shipment as early as possible

in the season. Our summer commences in December, and the chances of success in hatching the ova would be much more favorable if this could be performed before the temperature of the water has been materially raised by the summer heat.

I might have written more fully, but I assume that you will be able to obtain full information on any other points from Mr. Livingston Stone, or from other gentlemen in San Francisco who are interested in similar subjects.

In conclusion I would state that, as success is our object, we are prepared for a liberal expenditure to obtain it; and hope, therefore, that you will see that nothing is overlooked that would be likely to be of service in securing our end.

It will be advisable to take Mr. Stone's opinion as to the foregoing suggestions. His experience being of the highest value, you may modify any of my proposals to meet his views.

For reimbursement, I inclose a draft (first of exchange) on the Bank of California for £100. On shipping the ova, please forward to me particulars of your own and Mr. Stone's expenditure and charges, so that the account may be adjusted by return mail.

Yours, &c.,

T. F. CHEESEMAN,
Secretary Auckland Acclimatization Society.

Messrs. CROSS & CO.

AUCKLAND ACCLIMATIZATION SOCIETY,
Auckland, July 1, 1876.

DEAR SIR: In my letter of May 8, I stated that we should probably avail ourselves of your kind offer, forwarded through Messrs. Cross & Co., to supply us with salmon ova.

Since then we have induced several of the societies in the south of the colony to unite with us in the enterprise, and shall therefore require a larger number of ova than was at first anticipated. After due consideration, the council of the societies have decided to ask you to supply us with 250,000.

From a letter addressed by you to Messrs. Duncan & Co., a copy of which has been forwarded to us by Sir Julius Vogel, premier of this colony, I understand that you would undertake to deliver the ova at San Francisco, packed in boxes and ready for shipment. Our agents in San Francisco, Messrs. Cross & Co., have been instructed to attend to the other necessary arrangements, such as the construction of the ice-house on board the steamer, the packing of the boxes in it, and the supply of ice. I need hardly say that we should be especially grateful for any suggestions or advice that you can give to Messrs. Cross & Co. on the matter, and do not doubt but that with your kind assistance they will be able to make the shipment a success.

There is one point to which I should like to draw your attention and that is the great desirability of the consignment being forwarded as early in the season as possible. Our summer commences in December, and the hatching of the ova would, of course, be attended with a smaller amount of risk, if it could be performed before the temperature of the water is materially raised by the summer heat. If the ova could be dispatched in September we should then have time to have our hatching completed before the commencement of the hot weather.

Messrs. Cross & Co. will reimburse you for the expenditure you may incur on this account.

I remain, dear sir, yours obediently,

T. F. CHEESEMAN,
Secretary Auckland Acclimatization Society.

LIVINGSTON STONE, Esq.,
United States Fish Commission, California.

[Telegram.*]

NEW YORK, *June* 17, 1876.

American Fisheries Commissioners will deliver packed at San Francisco, half million salmon ova in November, and quarter million whitefish ova, for lakes, in February, for within four hundred pounds. Suggest vote to supplement societies. Success certain.

JAMES HECTOR.

Sir JULIUS VOGEL,
Wellington, New Zealand.

UNITED STATES GOVERNMENT BUILDING,
CENTENNIAL GROUNDS,
West Philadelphia, Pa., June 21, 1876.

DEAR DOCTOR: I think I can, without difficulty, carry out your promise to Sir Julius Vogel in regard to the fish eggs, by delivering in San Francisco, to any agent of the colony, properly packed for shipment, a half of a million of salmon eggs in November, and a quarter of a million of whitefish eggs later in the year, at a cost not exceeding £400 sterling.†

I have, &c.,

SPENCER F. BAIRD.

Dr. JAMES HECTOR,
Commissioner from New Zealand, Centennial, Philadelphia.

---

*A considerable portion of the following correspondence was published as an official document by the Government of New Zealand: "H.—14. 1877. New Zealand. Introduction of California Salmon (papers relative to the). Presented to both Houses of the General Assembly by command of His Excellency."

†This estimate was supposed to represent the increased cost merely of obtaining an extra supply of eggs, no intention of making any profit being entertained.

PREMIER'S OFFICE,
Wellington, July 26, 1876.

SIR: I send you herewith copy of a telegram I received from you on the 18th July.

2. I understand from it that you wish the government to place at your disposal an amount in excess of the subscriptions of the various acclimatization societies. You do not, however, name the amount you recommend; and, after some consideration, the government have decided to authorize you to expend not more than £500 in addition to any means the societies have placed at your command. This amount of £500 you must consider is to cover every liability of the government on account of the shipment, and all expenses in America, on the seas, and in New Zealand. Anything in excess must be defrayed by the societies.

3. On this understanding only, you are at liberty to draw on the treasury for any part or the whole of £500.

4. The government must stipulate for the right to determine how the ova shall be distributed. You will, in fact, see that the shipment is consigned to the government.

5. I have to thank you for the interest you are taking in this very important matter.

I have, &c.,

JULIUS VOGEL.*

JAMES HECTOR, Esq., M. D.

PREMIER'S OFFICE,
Wellington, July 29, 1876.

SIR: Supplementing my letter dated yesterday, I have been directed by the premier to say that the letter to Dr. Hector has reference to a supply of salmon and white-fish ova for the colony.

2. Since it was written, Mr. J. C. Firth, of Auckland, has telegraphed to the premier respecting a supply of ova which he anticipates will reach San Francisco in September or October.

3. I am to request that you will, as far as you can, assist toward the careful receipt and shipment of such ova.

4. You are not, however, to incur any expense on behalf of the government unless you are authorized so to do by Dr. Hector, to whom specific instructions as to the liability which may be incurred are being sent.

I have, &c.,

E. FOX.

R. J. CREIGHTON, Esq.,
San Francisco.

---

* The Premier of New Zealand.

PREMIER'S OFFICE,
Wellington, August 2, 1876.

GENTLEMEN: I have been informed that, by the September or October mail-steamer from San Francisco, there will be dispatched a shipment of salmon ova for the Acclimatization Societies of Auckland and Canterbury.

2. The government desire to aid those societies in the attempt to introduce American salmon to this colony; and I have the honor to request that you will cause instructions to be given, so that at San Francisco facilities may be afforded for the careful receipt of the ova, and at Kandavau time may be allowed and assistance rendered to insure their careful transshipment.

3. It is probable that in December, January, and February next ova may be received at San Francisco through arrangements made by Dr. Hector on behalf of the government; and I therefore ask that the instructions given to the captains and agents of the mail contractors' vessels may refer to these additional shipments, as well as to that on behalf of the Auckland and Canterbury societies. Directions have been given to the New Zealand mail agents to assist as far they can; and I am sure that you and your company will be ready to co-operate in a work which, if successful in the case of New Zealand, will be likely to lead to the speedy acclimatization of salmon in various parts of Australia.

I have, &c.,

JULIUS VOGEL.

Messrs. GILCHRIST, WATT & CO., *Sydney.*

SYDNEY, *August* 22, 1876.

SIR: We have the honor to acknowledge receipt of your letter of 2d instant, respecting shipments of salmon ova expected from America.

We send by the outgoing mail copy of your letter to the general agents at San Francisco, with a request that they will do all in their power to see the wishes expressed carried out, and every attention paid, so as to insure success to the introduction of the ova.

We have, &c.,

GILCHRIST, WATT & CO.,
General Agents for the Contractors, San Francisco Mail Service.

The Hon. the PREMIER, *Wellington.*

DUFF & CO., COMMISSION MERCHANTS,
316 *Davis Street, San Francisco, August* 30, 1876.

DEAR SIR: By last New Zealand mail I received a few lines from my friend, Mr. Ormond, who says: "Our government have made an appropriation for the purpose of obtaining a supply of salmon and white-fish ova from California; and Dr. Hector, State geologist, has been commissioned

to procure it. I have written him and requested him to communicate with you, as it is possible that he may fit up a special ice-house, in which case there will be no difficulty in arranging that the Hawke's Bay ova should come in the same ice; but, in any case, we depend upon your sending us ova; 50,000 from the same source as last year, independent of the supply ordered by the New Zealand government," &c. &c. Upon receipt of Mr. Ormond's letter, I made inquiries for Dr. Hector; and his friends inform me that he returned to New Zealand per last steamer, having left Mr. Creighton to attend to his affairs here. Mr. Creighton called upon me last night, but does not seem to know very clearly what arrangements Dr. Hector has made, though he gave me to understand that arrangements had been made with you for the whole supply. I do hope this is correct, for, as I told Mr. Creighton, I know of no other way that such a supply can be obtained, properly packed, &c. I trust, however, that my commission, though small, may not be neglected. And if not asking too much, I would feel particularly obliged by your informing me the earliest date at which they could be ready, as, if I can get them in time for the Australian steamer of the 10th October, I ought to write Mr. Ormond by next mail, in order that he could have supplies of ice ready at Kandavan and Wellington, at which places they must be transhipped before reaching Hawke's Bay. Of course, if I got them sent with the large supply for the New Zealand government, it would simplify matters very much, but until I am sure that they have made better arrangements I must do the best I can myself. I have also now on hand the amount paid last year through Mr. Kaeding, for the 50,000 got then, $150. As it is not mine, and I am directed by the Acclimatization Society to pay it for the ova, please state when you write whether I shall send you a check or the coin, and how, as you can use it in packing the fish, and paying for transporting them to W. F. & Co.'s office. Trusting you will excuse the trouble I give you, and which I can assure you either Mr. Ormond or myself would gladly repay if in our power.

I remain,

ROBERT P. R. DUFF.

LIVINGSTON STONE, Esq.

SAN FRANCISCO, CAL.,
September 12, 1876.

SIR: In reply to your communication of the 8th and 9th July, written by direction of the premier, and covering a letter to Dr. Hector, I have to state that Dr. Hector sailed by the previous steamer for New Zealand. He told me that he had arranged for the shipment of 150,000 salmon ova and a quantity of whitefish from the East, and that he would write, giving instructions regarding their shipment, but I suppose he overlooked doing so in the hurry of departure, as I received no letter from him.

Since then, I learned from Messrs. Cross & Co., who are acting for the Auckland Acclimatization Society, that the United States Commis-

sioner of Fisheries telegraphed instructions to Mr. Livingston Stone, who is in charge of the breeding-ponds in this State, on no account to send salmon ova to New Zealand, inasmuch as the receipt of the first parcel had not been acknowledged, while the newspapers credited the supply to Columbia River, where there are no breeding-ponds, the fisheries being in private hands. Messrs. Cross have written to the United States Commissioner, and their explanation may be sufficient. Meanwhile I retain letter of instructions to Dr. Hector for another mail, and, should circumstances in my judgment warrant it, I will open it and ascertain the mind of the government, as I propose, if necessary, making an effort to procure the ova on the terms arranged by Dr. Hector. As I have already explained, it may not be necessary, owing to Messrs. Cross & Co.'s action in the matter. I shall not incur any expenditure on account of the government unless authorized to do so. Would you be good enough to communicate the contents of this letter to the honorable the premier, and oblige?

Yours, &c.,

R. J. CREIGHTON.

E. Fox, Esq.,
Private Secretary, &c., Wellington.

MEMORANDUM BY DR. HECTOR *re* SALMON OVA.

As there appears from Mr. Creighton's letter of the 12th September, addressed to the private secretary (Mr. Fox), to be some confusion between the orders sent by the government and by the acclimatization societies for the shipment of salmon ova from America, I beg to state the circumstances, so far as I am acquainted with them.

In conversation with Mr. Spencer F. Baird, chairman of the United States Fishery Commission, when at Philadelphia in the beginning of June, I was made aware of the extensive establishment which the United States Government maintains for the breeding and dissemination of valuable species of fish; and, also, that some kinds of salmon found on the Pacific slope of the continent had proved by experience to be most suitable for the purpose of acclimatization in other waters, from their hardy habits, great fertility, and high commercial value. I inquired whether it would be within the functions of the American commission to co-operate with the New Zealand Government for the purpose of introducing salmon into that country. Professor Baird said he had authority to do so, and that the commissioners would take great interest in insuring the success of the experiment, which had already been tried on a small scale through the Auckland society. He recommended that a large shipment should be made as the best way of insuring success, and, after some days' consideration, he informed me that the commissioners would make no charge for the ova, and only required to be repaid the expense of packing and delivery of the boxes of ova in San Francisco. He proposed that half a million of salmon ova should be sent

by the October or November mail-steamer this year, to be followed in February by a quarter of a million of the ova of the white fish (*Coregonus albus*), which is a very valuable species of salmonoid, for acclimatization in our lakes, and estimated the cost at £400. Fearing that I might traverse arrangements entered into in the colony for the same purpose, and thus cause more ova to be sent out than could be reared in the breeding-houses in New Zealand, I inquired if any such order had been received, and being assured to the contrary, as such an arrangement could not have been made without Professor Baird's knowledge, I telegraphed to Sir Julius Vogel, on the 17th July, to overtake the San Francisco mail, informing him of terms on which the ova could be obtained, and suggesting a vote on the same terms as on former occasions, viz, that acclimatization societies should bear half the expense, at the same time forwarding a copy of the telegram to Professor Baird, who replied (21st June), "I think I can, without difficulty, carry out your promise to Sir Julius Vogel in regard to fish eggs, by delivering to any agent of the colony in San Francisco, properly packed, a half-million of salmon eggs in November, and a quarter-million of white fish eggs later in the year, for the sum of £400 sterling."

On reaching San Francisco, on the 10th August, I spoke to Mr. Creighton, and also to Mr. Craig, of the New Zealand Insurance Company, and to the British consul, Mr. Booker, all of whom agreed to see to the arrangements for shipping the ova in case instructions should have been sent by government to the Fishery Commission, or if they arrived in San Francisco after I left on the 16th.

From Honolulu, finding no instructions had been directed there from the colony, I wrote to Professor Baird, telling him that, in the event of the Government of New Zealand approving of the arrangement I had entered into with him, the ova would be delivered to Mr. Creighton, and requesting him to address any further communication on that subject to that gentleman. At the same time I pointed out to him that the season was too far advanced for receiving so large a consignment of salmon ova this year; but I still hoped that the shipment of whitefish ova would be approved of by government, and sent as contemplated, and that the salmon ova could follow next season. I also wrote to Mr. Creighton, telling him that I had received no instructions at Honolulu, and leaving the matter in his hands in case he should receive any instructions.

On arriving at Wellington, on 16th September, I found that a letter of instructions from Sir Julius Vogel, dated 26th July, had crossed me between San Francisco and Honolulu, and that a copy had been sent to Mr. Creighton. This letter authorized the expenditure of £500, to cover every liability of the government for shipment, and all the expenses in America, on the seas, and in New Zealand. Anything in excess to be defrayed by the societies. Under the circumstances I recommend the vote still to be taken, although a small part may be required this year for the white-fish ova.

Respecting the memorandum from the Hon. Dr. Menzies, I concur in the importance of carrying out to its completion, as he suggests, the experiment of acclimatizing the English salmon, which has so far been successful in the shipment by the Durham last year.

But any further expenditure I think should be directed to the introduction of American salmon. In case the funds voted are not sufficient both for the maintenance of the Southland ponds and for the introduction of American ova, I think the preference should be given to the former.

JAMES HECTOR.

OCTOBER 17, 1876.

SAN FRANCISCO, CAL., *October* 10, 1876.

SIR: In continuation of my letter of 12th September, 1876, I have to state, for the information of the honorable the premier, that through the active agency of Messrs. Cross & Co., of this city, acting for the Auckland Acclimatization Society, Professor Baird, United States Commissioner of Fish and Fisheries, rescinded his previous order, and gave instructions to Mr. Stone, the officer in charge of the McCloud River establishment, to send supplies of salmon ova to New Zealand.

2. Messrs. Cross kindly permitted me to peruse this correspondence, and as Professor Baird expressed his keen sense of dissatisfaction at the want of courtesy by the consignees of the first shipment of salmon ova to New Zealand, I felt it to be my duty to explain how this had unavoidably occurred. Professor Baird replied to my letter in a spirit of friendly interest in the experiment; and I have written informing him that the ova are on board, and that he will be kept fully apprised of the result of the experiment in every stage.

3. As this is the only occasion on which the Commission on Food Fishes of the United States has forwarded a supply of salmon eggs to a foreign country, it is important that it should be notified of the most minute facts observed during the progress of the experiment. If successful, the commission will have added enormously to the food supply of New Zealand, thereby increasing the wealth and comfort of the population, and providing an inducement to settlement of the most valuable character.

4. I likewise wrote to Mr. L. Stone, United States commissioner, Redding, Cal., in charge of the McCloud River establishment, explaining to him substantially, as I had previously done to Professor Baird, the cause of non-acknowledgment by the consignees of the receipt of the ova, and impressing upon him the importance of sending the full quantity authorized. Mr. Stone having gone East about this time, I received no reply; but I am pleased to say that the ova arrived in good order to-day, and are packed in the ice-house of the Zealandia, which has been set apart for this purpose.

5. The shipment for the New Zealand Government, addressed to Dr.

Hector, consists of two crates, containing 84,000 eggs. Fifty thousand eggs are on board for Napier, a very large supply for the Auckland Acclimatization Society, and a parcel for Christchurch. The total supply is greatly in excess of the quantity supposed to be available by Professor Baird. This is a fortunate circumstance, inasmuch as it increases the chances of success of the experiment.

6. Mr. Cheeseman, a postal agent, and the commander of the Zealandia have charge of the shipment. Everything depends upon the transhipment and subsequent voyage to New Zealand, but as there is abundance of ice on board the risk is slight.

7. On receiving no further instructions by the last mail, I opened the letter of instructions to Dr. Hector, but I have not gone in any way to pledge the government to pay money, other than as Dr. Hector had agreed to do. Professor Baird's letter, attached, will show the unsettled character of the arrangement, which does not appear to be understood by the professor. The following extract from my letter to Mr. Stone on this subject, which is the only portion of this letter I need forward to you, will show the exact length to which I have gone in pledging the government to pay money: "Messrs. Cross & Co. and Mr. Duffy are in funds for the Auckland and Napier shipments, and the New Zealand Government will give effect to Dr. Hector's arrangement with yourself and the United States Commission at Washington."

8. The understanding here is that the cost of freight, ice, &c., shall be borne *pro rata* by the consignees. Messrs. Cross & Co. conducted the shipping business, and the government will doubtless hear from them through the Auckland Acclimatization Society. The expense in this way will not be large.

9. I have to request attention also to that part of Professor Baird's letter in which he intimates that applications for further supplies should be made early in spring. There was something like a scramble in the present business, and this is to be avoided in future. The colony is now in perfect accord with the United States Fish Commission, and if attention be paid to its requirements as to official recognition and information regarding the fish-breeding experiment, great and lasting good must result to the country.

10. I have not promised any gratuity to the commander of the Zealandia, nor to Mr. Cheeseman, but I presume, if the ova are landed in good condition, their services will not be overlooked. As I take a deep interest in this matter personally, I should like to be informed of the result of the experiment, about which many of the leading citizens of San Francisco are anxious.

I have, &c.,

R. J. CREIGHTON,
Resident Postal Agent.

E. Fox, Esq.,
Private Secretary, Wellington.

SAN FRANCISCO, CAL., *September* 20, 1876.

SIR: Messrs. Cross & Co., San Francisco, read to me your letter authorizing Mr. L. Stone to prepare for shipment for New Zealand, by the October steamer, three parcels of salmon ova. I have the honor to thank you on behalf of the consignees for the liberality of your order, and your kindness in overlooking the informal applications from New Zealand. The consignees will themselves, in due course, thank the United States Fishery Commission, and present their apologies for any seeming disrespect of which you may have had reason to complain.

2. Permit me to explain, however, that the first shipment of ova, through Mr. Duffy, of San Francisco, for Napier, never reached its destination. The steamship having it on board went direct to Sydney, and, failing to obtain a fresh supply of ice there, it was found that the ova had begun to hatch out on arrival in Auckland, New Zealand, on the up trip; whereupon Mr. J. C. Firth took a portion of the eggs and placed them in the Auckland Acclimatization Society's ponds; the result was that a considerable proportion was saved, and young, healthy fish were deposited in a few streams in the province of Auckland. So far the experiment was a success; but writing of it, credit was given by the local press, entirely through ignorance of the facts, to Columbia River, and not to the McCloud River establishment of the United States Fishery Commissioners. Had the ova arrived at their destination, doubtless the mistake would not have occurred.

3. Finding that ova of California salmon could be successfully introduced into New Zealand (experiments from Great Britain theretofore having failed) the Auckland Acclimatization Society, in concert with a similar society in Christchurch, in the Middle Island of New Zealand, in which there are many suitable streams, applied through Cross & Co., as you are aware, for 150,000 eggs; Hon. Mr. Ormond, superintendent of Hawkes Bay, applied through Mr. Duffy of this city, for 50,000; and Dr. Hector, while in Washington, also applied for 50,000 on behalf of the New Zealand Government, for which, also, he was commissioner at the Centennial Exposition. (I have used the figures in Dr. Baird's letter as the quantities applied for.) These are the parcels of which you have been pleased to authorize the shipment, and for which, I have no doubt, you shall be officially thanked.

4. I have noted your remark to Messrs. Cross, and will communicate the same to the New Zealand Government and the other parties interested, that "This contribution has been made by the United States Fishery Commission from its establishment at McCloud River, California, and that the credit arising from the successful experiment should be assigned to the United States Government for its action in the matter; also that the consignees shall address their acknowledgments, as well as an account of the condition of the eggs and their subsequent experience of the fish, to you, as Commissioner of Fish and Fisheries, Smithsonian Institution, Washington."

5. I feel this explanation is necessary under the circumstances, and because I also know that very great regret will be felt in the colony when they learn that any difficulty has arisen through an informality and apparent want of courtesy on their part. Very great interest is taken in this matter in New Zealand, and the liberality of the United States Government, through its Fish and Fishery Commission, will be gratefully acknowledged by that country.

I have, &c.,

ROBERT J. CREIGHTON,

Resident Postal Agent for the New Zealand Government.

Hon. SPENCER F. BAIRD,

United States Commmissioner of Fisheries, Washington.

UNITED STATES GOVERNMENT BUILDING,
CENTENNIAL GROUNDS,
West Philadelphia, Pa., September 28, 1876.

DEAR SIR: I am in receipt of your letter of the 20th of September, and trust that Mr. Stone will be able to meet my request to supply a series of salmon eggs to the several colonies of New Zealand.

Owing, however, to the comparatively late period of the application and of the transmittal of instructions, it is barely possible that the full measure can be given. Future applications should be made early in the spring.

My request to Mr. Stone, to send 50,000 eggs to Dr. Hector at Wellington, was on my own motion. When I saw the doctor last in Philadelphia, he proposed to obtain a grant of money from the colonial authorities for the entire service, without specifying the stations or quantities, since which I have not heard from him.

I have, &c.,

SPENCER F. BAIRD.

ROBERT J. CREIGHTON, Esq.,

Postal Agent, New Zealand Government, San Francisco, Cal.

SAN FRANCISCO, CAL., *October 10, 1876.*

DEAR SIR: I am in receipt of your favor of the 28th September, and have to thank you for your courteous attention and the readiness with which you complied with the informal applications from New Zealand for salmon ova. I have already written to the colony, explaining the position of the United States Fishery Commission in this matter, and I have no doubt you will be kept fully informed of the result of the experiment through its several stages. I am happy to state that the ova arrived to-day, and were packed in ice in the ice-house of the Zealandia mail-steamer, which has been appropriated to its use. It is an iron air-tight chamber on deck, and will suit admirably. It will not be dis-

turbed during the voyage to Fiji, where a transshipment takes place. This is the only point of difficulty, but I do not apprehend much danger to the eggs, the time occupied being so short.

2. Dr. Hector wrote to me from Honolulu, stating generally the arrangement or understanding for the supply of eggs from the McCloud River establishment; but as his instructions from the New Zealand Government passed him on the way, I think it is better to let the question of money rest until he has had an opportunity of writing from the colony, after consulting the government, which he has had by this time. I may say, however, that the New Zealand Government has funds at its disposal for this purpose to an amount greater than is likely to be required. In all likelihood the whole question will be definitely settled by next mail. Dr. Hector informs me that he had arranged for a supply of whitefish from the East next spring, but, for the reason already stated, I cannot go into details. However, the entire service will be satisfactorily arranged, I have no doubt.

3. In his letter, Dr. Hector informed me that he had written to you, but as his correspondence came by sailing-packet, doubtless it did not reach you so soon as it otherwise might have done. I inclose copies of this correspondence to the New Zealand Government.

I have, &c.,

R. J. CREIGHTON,
Resident Agent, New Zealand Government.

Hon. SPENCER F. BAIRD.

WELLINGTON, *November* 16, 1876.

SIR: Upon the return of Dr. Hector from the Centennial Exhibition at Philadelphia, and having received his report of his proceedings in the United States, it becomes my gratifying duty to tender to you the thanks of the Government of New Zealand for the eminent and valuable assistance rendered by you to this colony in the person of its representative at the Exhibition.

I desire, further, to thank you for the hearty co-operation of the commission over which you preside in the efforts of this country to obtain a stock of food-fish from America. You will be glad to hear that the first consignment to the government of 84,000 salmon ova, contributed by Mr. Stone, the officer in charge of your establishment at the McCloud River, has arrived safely and in good order so far as yet reported on. You will no doubt be informed of the result of the separate shipments to private order from Auckland, Hawke's Bay, and Canterbury, by the local acclimatization societies at those places.

I shall have pleasure in sending you advices of the further progress of the government importation by future opportunities.

I have instructed Mr. Creighton to ascertain from Mr. Stone and to draw for any amount that may be due from the government of this

colony to the United States Commissioner on account of the shipments of ova per Zealandia in October.

We shall be very glad to receive, through your kind offices, a shipment of whitefish ova in February next, as has, I understand, already been arranged for by Dr. Hector, and shall always be thankful to yourself, the commission, and the United States Government for your further co-operation and assistance on future occasions in our endeavors to increase the stock of food-fish in New Zealand by importation from America.

I have, &c.,

DANIEL POLLEN.*

Hon. SPENCER F. BAIRD,
Chairman United States Fishery Commission.

UNITED STATES COMMISSION FISH AND FISHERIES,
Washington, December 21, 1876.

DEAR SIR: I have the honor to acknowledge the receipt of your letter of November 16th, and beg to say, in reply to that portion of your letter relating to any assistance rendered to Dr. Hector, the commissioner at Philadelphia, that it was duly warranted by the eminent personal and scientific qualities of Dr. Hector himself. I beg to assure you that no one stood higher in the regard of all Americans who were brought in communication with him, or among his fellow-commissioners, than he did, and his premature departure was a source of unceasing regret.

I beg also to express my gratification of the safe arrival of the eggs of the California salmon, as presented to the various colonies of New Zealand by the United States Fish Commission. I have full faith in the probable success of the experiment, and should an additional stock be desired, will take great pleasure in furnishing them, if the establishment is kept up by the United States. I shall be glad to have the further advices promised in regard to the fish from time to time.

One-quarter of a million whitefish eggs will be sent to San Francisco in the course of the present month, with instructions to place them in charge of Mr. Cross and Mr. Creighton, for transmission to Wellington.

Hoping that these may arrive in a satisfactory condition,

I have, &c.,

SPENCER F. BAIRD,
Commissioner.

The Hon. COLONIAL SECRETARY.

WELLINGTON, *November* 16, 1876.

SIR: I am directed by Dr. Pollen to acknowledge the receipt of your letters addressed to Mr. E. Fox, under date the 12th of September and 20th of October, with inclosures to the latter, upon the subject of the

* The honorable colonial secretary of New Zealand.

shipment of salmon ova to New Zealand; and I have much satisfaction in informing you that the supply addressed to the government, which was shipped from San Francisco per Zealandia, and transshipped into the city of New York at Fiji, arrived safely and in good order so far as yet reported on. They were transshipped at Port Chalmers for the Bluff, and thence forwarded to the Makarewa Ponds near Invercargill, where the process of hatching has proceeded so far satisfactorily.

The government are writing to Professor Baird, conveying their thanks for this the first shipment of eggs consigned to them by the United States Fishery Commissioners, and thankfully accepting the offer of further aid.

The government have also confirmed the order for whitefish ova in February next.

I inclose a copy of Dr. Pollen's letter to Professor Baird.

I am now directed to request that you will be good enough to ascertain from Mr. Livingston Stone the amount that is due from the Government of New Zealand to the United States Fishery Commission, or to the branch of it which he represents, in respect of the government's share of the recent shipment, and to authorize you to draw for the same upon the colonial treasurer.

In conclusion, I am directed to convey to you the thanks of the government for the trouble you have taken in giving effect to their wishes upon this subject.

I have, &c.,

G. S. COOPER.*

R. J. CREIGHTON, Esq.,
San Francisco, Cal.

SAN FRANCISCO, CAL., *November* 7, 1876.

SIR: In continuation of my letter by last mail, on the subject of salmon ova for New Zealand, addressed to Mr. E. Fox, for the information of the premier, I inclose a note from Professor Baird, in which he states that no charge will be made for the shipment by last steamer, beyond the cost of packing at the station and transportation to San Francisco. He also intimates that the whitefish, which Dr. Hector arranged for, will be forwarded in due course. I shall attend to his request, and write reminding him of the matter. I think the liberality of the United States Fish Commissioners should be suitably and promptly acknowledged by the New Zealand Government. In the matter of acclimatization much might be done if the societies would place themselves in the hands of the government, and permit them to conduct the negotiations. It would be an easy matter to arrange for distribution in the colony.

I have, &c.,

R. J. CREIGHTON.

The UNDER SECRETARY,
Wellington, New Zealand.

* Under secretary of the government of New Zealand.

[Inclosure in last letter.]

UNITED STATES GOVERNMENT BUILDING,
CENTENNIAL GROUNDS,
West Philadelphia, Pa., October 20, 1876.

DEAR SIR: In reply to your letter of the 10th of October, I beg to express my gratification at hearing the salmon eggs were duly received, and would be shortly forwarded by the Zealandia. I am not entirely satisfied as to the propriety of inclosing them in an air-tight ice-house, as they will require a certain amount of oxygen for their proper development.

I do not propose to make any charge for supplying the eggs for the present shipment, merely reclaiming the cost of packing at the station, and transportation to San Francisco. Possibly, in any additional contributions of magnitude, I may feel bound to assess a portion of the actual expenses. The whitefish are provided for, and I hope will be furnished at the proper time. May I ask you to remind me of this by letter, to reach me about the 1st of January?

I have, &c.,

SPENCER F. BAIRD.

ROBERT J. CREIGHTON, Esq.,
San Francisco, Cal.

AUCKLAND ACCLIMATIZATION SOCIETY,
Auckland, November 17, 1876.

SIR: I am directed by the Council of the Auckland Acclimatization Society to convey to you their very hearty thanks for the consignment of California salmon ova forwarded to us under your directions by Mr. Livingston Stone, and which was duly received by the last mail-steamer.

You will be glad to hear that the consignment arrived in excellent condition, and has been hatched with an unusually small percentage of loss. The young fish are now doing well, so that we have every reason to hope that your kind and liberal action in this matter will be the means of enabling us to establish in our rivers a fish of great economic value, and thus confer a benefit of lasting value on the whole community.

I inclose an extract from the Daily Southern Cross newspaper, published in this city, that may perhaps interest you; and again expressing my sense of the obligations under which you may have laid this society, I beg to subscribe myself,

Yours, most obediently,

T. F. CHEESEMAN,
Secretary.

Prof. SPENCER F. BAIRD,
Commissioner of Fish and Fisheries, Washington, U. S.

AUCKLAND, NEW ZEALAND, *November* 20, 1876.

SIR: I have the honor to inform you that the salmon ova forwarded by your kind instructions from the UnitedStates Fish Commission from its establishment on the McCloud River, California, have arrived in excellent condition.

I have also to inform you that the parcels of ova intended for Dr. Hector and the Napier and Canterbury societies were duly forwarded. I am advised that the two former lots arrived in good order, and have since hatched out well. From Dr. Hector I have not heard. The Auckland portion has been placed in hatching-houses erected by our acclimatization society in very suitable localities, under my personal supervision. You will be glad to learn that, owing to the almost perfect fecundation of the ova, and the admirable arrangements made by Messrs. Cross & Co., of San Francisco, for their safe transport, the hatching has been most successful.

There is now, I think, every probability that the great experiment of introducing California salmon into the rivers of New Zealand will be a splendid success.

For this result we are entirely indebted to the noble generosity of the United States. More especially is the colony indebted to you, under whose charge the Fish Commission carries on its most useful and wide-extended labors.

On behalf of the Auckland and Canterbury Acclimatization Societies, I beg to tender you the warmest thanks for your generosity in supplying the colony of New Zealand with the king of fishes.

The consignment of last year also came from you, of which at the time we were ignorant. I inclose a slip, giving some particulars of their disposition.

Regarding this shipment, I may say that young salmon 7 to 8 inches in length have been seen in the rivers in which I placed the ova last year.

I have the honor to be, sir, your obedient servant,

J. C. FIRTH,

President of the Auckland Acclimatization Society.

The Hon. SPENCER F. BAIRD,

United States Chief Commissioner of Fisheries.

SAN FRANCISCO, CAL., *December* 15, 1876.

DEAR SIR: By the last steamer from New Zealand I received a few lines from the Hon. J. D. Ormond, government agent for the province of Napier, in which he says "The ova, per steamer Zealandia, were received in splendid condition by the Hawkes Bay Acclimatization Society, and the fish are now hatching rapidly. Will you kindly report to the proper authorities at Washington on the success of the experiment so far, and express on behalf of the Hawkes Bay Acclimatization Society, our sincere thanks for the very liberal treatment we have received? A proper

official acknowledgment shall be sent to the Hon. Spencer F. Baird so soon as we are able to report the hatching and turning out of the fish.

I can only add my own thanks to those of the Hawkes Bay Acclimatization Society.

I have the honor to be, yours, respectfully,

ROBT. P. R. DUFF.

Hon. SPENCER F. BAIRD,
United States Commissioner of Fish and Fisheries, Washington, D. C.

COLONIAL MUSEUM, WELLINGTON, NEW ZEALAND,
December 13, 1876.

MY DEAR SIR: I have to thank you for your note of 3d October, and for the trouble you have taken in procuring the salmon ova for us. You will be pleased to learn that the venture has been, as you predicted, a perfect success. About 90 per cent. of the ova have been hatched. They have been divided among four different localities, from one end of New Zealand to the other, and we must now have nearly 300,000 healthy fish. The 84,000 you sent to me were sent on to Southland, where the best ponds are situated. They will be turned out in some splendid rivers along with young Scotch salmon. I still require a supply to stock the rivers on the west coast, and particularly the large rivers that flow into the Fjords, where they should thrive well. Government has authorized me to prepare to raise whitefish. The sum of £800 has been voted this year for pisciculture. I believe we have to thank your strong expressions of interest for procuring this vote.

Hoping to hear soon from you, believe me, dear sir, I remain yours,

THOMAS HECTOR.

AUCKLAND, NEW ZEALAND, *December* 16, 1876.

SIR: In accordance with your wish (conveyed to me by my friend Mr. Creighton), I avail myself of this opportunity to give you a short account of the results, so far, of the salmon ova which you, as chief of the United States Fish Commission, so generously presented to this colony.

As I have already informed you, I forwarded, with fresh supplies of ice, the various boxes of ova to Napier, Canterbury, and Wellington. You will be pleased to learn that all these parcels arrived in excellent condition at their respective destinations, and have all hatched out with great success.

I now come to the treatment and results of the salmon ova you kindly fowarded to the Auckland Acclimatization Society. The rivers of this colony are remarkably destitute of fish. Except five or six kinds, all, either small or of little value either for sport or food, our rivers have no

inhabitants except eels, and of these, some of our northern rivers are full. These eels, with the wild ducks and sea-shags,* are very terrible enemies to all the finny tribe. I think it not unlikely that these creatures have produced that remarkable absence of fish in our rivers to which I have already alluded. There is one other difficulty with which we, in the north, have to contend in introducing such a fish as the salmon, viz, a high temperature of our rivers. North of 37° south (on which Auckland City is placed), I do not think we shall succeed with this fish.

With this digression, permit me now to describe the three locations in which I placed the ova, and the appliances I had prepared for their treatment, together with the results of these operations:

1. The first location was in a wooded dell in the "Domain," near the city of Auckland, a very charming and romantic spot, rich in indigenous plants and trees. Through this little shady dell a cool streamlet runs, with a temperature of 62° at this season, our early summer. Here I erected a fish-house fitted with sixty boxes, each four feet long, twelve inches deep, and ten inches wide. The bottom of each box was covered with small shingles.† On a notched frame two inches from the top we placed a row of hollow glass tubes three-sixteenths of an inch apart. In these we deposited the ova. The boxes were placed in tiers of five, one above the other, like steps. The water ran from the upper box to the next of the tier on a little fall of four inches, imparting a gentle and constant motion to the water in each box. The day after they were deposited the ova began to hatch, and in five days all were hatched except about one per cent. of ova, which had not been perfectly fecundated.

Shortly afterward we noticed a rather heavy mortality, arising, probably, from the circumstance that one of the original packages of ova had had a fall, or had in some way been crushed a little. The weather becoming more sultry, the mortality continued, though at a less ratio. The young fish having absorbed the "sac" (about thirty days after being placed in the boxes), are fine, lively, healthy fellows.

2. The second location is fifteen miles south of the city, on a pretty shingled river named the "Oratia." A similar arrangement was adopted to the one already described. In this case also the ova hatched splendidly, and were doing well until the fourteenth day, when the temperature of the atmosphere suddenly rose to 99°, and that of the water from 65° to 70°. In that day we lost one-half the fish. On being apprised of the calamity, I immediately rode out, and finding the water at 67°, and the remaining fish looking sickly, I at once turned them out into the main river where the water was at a lower temperature. The absorption of the "sac" was not complete, but I hope that a fair amount of success may be realized.

3. The third location was made on a charming river full of shingle, little rapids, and deep pools. This river, called the "Rapurapa," has

* One of the species of cormorants.

† Beach pebbles.

very clear, cold water, and is one of the numerous head waters of the river Thames, which is itself the *beau ideal* of a salmon river in every respect, having abundance of shingle, rapids, deep holes, with bright, cold water, and, after a course of about one hundred and fifty miles, debouching into the sea at a fine, shallow, but extensive gulf called "Hawraki." The point I selected on the "Rapurapa" was where a small, low island afforded a branch about sixty feet long by fifteen feet broad and two feet deep, running with a pleasant music and sparkling motion over a shingle bed. At the upper point of the little island I made a breakwater of shingle rising two feet above water level, and running across to the river bank. I constructed a similar breakwater at the lowest point of the island to the bank, in this manner inclosing a space sixty feet long by fifteen feet wide. Shading this little spot from the sun's rays, I placed among the shingles, with the ready and skillful help of the Maoris (the aboriginals of this country), about 36,000 ova, which, though I had transported them a long distance over a somewhat rough road, were in excellent condition. A few ova near the edge of the original packages were just hatching out as I placed them in the river. This location has been most successful. Two days after I deposited them, three eels insinuated themselves into the inclosure; but my Maori friends, faithfully carrying out the promise they made me to watch closely for every enemy, whether eel, duck, shag, or kingfisher, caught them at once, but not before they had swallowed some of the ova. On cutting them open, they took out some ova which they put again in the inclosure, and which have since hatched out. And by way of "*utu*" or payment, as they term it, the Maoris immediately cooked and ate the enemy, since when the place has not been molested. Every duck or shag that made his appearance was at once shot by these watchful guardians. You will be glad to learn that in this location the success has been complete. As they absorbed the "sac," batches of bright, strong young fish worked their way through the shingle barrier and went up stream, and so on day after day, till now nearly all have migrated from the hatching ground.

The great success of this third location leads me to the conclusion, that, where you can find a suitable and safe spot in the small shingle streams forming the headwaters of the main rivers, it is much more advantageous to place the ova there, than in any more artificial hatching-ground.

Pardon this long account, with which I should not have presumed to trouble you, unless Mr. Creighton had conveyed your request to me.

I believe the localization both this year and last, of the salmon in this colony to be completely successful, and for this great boon, filling as it will, our beautiful but barren rivers with this most valuable fish, and providing abundance of wholesome food for the present and coming generations—we have to thank the noble and disinterested generosity of the United States people, who, by means of their Fish Commission, di-

rected with so much success by your earnest and unwearied efforts, are conferring so great a blessing upon people who are strangers to them. In the coming times it will be a grateful thing for us to remember, and a proud memory for you to know, that to the United States this colony will owe the "King of fish."

J. C. FIRTH,
President of the Acclimatization Society, Auckland, N. Z.

Hon. SPENCER F. BAIRD, Esq.,
Chief of the United States Fisheries Commission, Washington.

SAN FRANCISCO, CAL., *January* 3, 1877.

SIR: I have to state, in reply to your letter of 16th November, 1876, that I put myself into communication with Professor Baird and Mr. Stone, as therein directed. I have not heard from the latter. I inclose correspondence.

During my absence in Southern California two boxes of whitefish eggs arrived, as advised by Dr. Baird, and were placed in the ice-house here, waiting the departure of the mail. Preparations were made for their reception on board the steamer, and yesterday I saw the box for New Zealand packed in ice in a loose case, and drove with it to the vessel, where it was transferred to the ice-house in my presence. It will be similarly packed for transfer at Kandavau. Next steamer the second instalment of 125,000 whitefish eggs will be forwarded. I trust these will arrive safely. As I have not been furnished with any account for salmon shipment, I cannot draw upon the government for any amount. I am greatly indebted to Hugh Craig, esq., agent for the New Zealand Insurance Company, who, in my absence from town, gave the necessary instructions.

I have, &c.,

ROBT. J. CREIGHTON.

G. S. COOPER, Esq., *Under Secretary, Wellington.*

[Inclosure in last letter.]

SAN FRANCISCO, *December* 14, 1876.

SIR: I have the honor, by direction of the New Zealand Government, to request that you would be good enough to inform me the amount that is due from said government to the United States Fishery Commission, or to the branch of it which you represent, in respect of the government share of the recent shipment of salmon ova to Dr. Hector's address, for which I am authorized to draw on the colonial treasurer of New Zealand. As I am going out of town for a few days, should your letter not receive prompt attention you will understand the cause of the delay.

I have, &c.,

R. J. CREIGHTON,
Resident Agent, New Zealand.

LIVINGSTON STONE, Esq.,
United States Fish Commission, Redding, Cal.

[Inclosure in last letter.]

SAN FRANCISCO, *December* 14, 1876.

DEAR SIR: I have much pleasure in informing you that the shipment of salmon ova arrived at its destination in excellent order, and that the hatching out has been successful. The press of New Zealand has acknowledged the liberality of the United States Fish Commissioners, and I am advised that the colonial secretary has written to you expressing the thanks of the New Zealand Government for your considerate attention to their requests. Mr. Firth, president of the Auckland Acclimatization Society, writes in similar terms, and doubtless you will have received a letter from him before this reaches you. I forward to your address a copy of the Auckland Southern Cross, containing a notice of the arrival of the consignment of eggs, and I have arranged to forward to you copies of the San Francisco Evening Post, containing a special article on the subject.

In obedience to instructions, I have requested Mr. Stone to inform me the amount of indebtedness by the New Zealand Government on account of their share of the shipment, on receipt of which the money will be paid.

I trust there will be no difficulty in the way of supplying the whitefish arranged for by Dr. Hector, which you requested me to remind you of about the new year.

I am certain the success of the experiment hitherto will be a source of satisfaction to yourself, as, unquestionably, it is to all classes in New Zealand.

I have, &c., R. J. CREIGHTON.

Hon. S. F. BAIRD,
Washington, D. C.

[Inclosure in last letter.]

NATIONAL MUSEUM, SMITHSONIAN INSTITUTION,
Washington, December 12, 1876.

DEAR SIR: I propose to send, about or after the 20th of December, a quarter of a million of whitefish eggs to the Acclimatization Society at Wellington, care of Dr. James Hector, and I beg that you will kindly take charge of the shipment of these, paying the necessary expenses of transportation from Northville, Mich., and of fitting up any provision on the steamer for their safe transmission. The weather will be so cool that a delay of some time in San Francisco will probably not affect them. It is probable that these eggs will be sent to Mr. B. B. Redding, fish commissioner of California, with some for the California commission. Please see Mr. Redding on this subject. I cannot tell here when the steamer leaves, but hope the eggs may go on soon after reaching San Francisco.

I have, &c.,

SPENCER F. BAIRD.

R. J. CREIGHTON, Esq.,
San Francisco, Cal.

[Inclosure in last letter.]

UNITED STATES COMMISSION FISH AND FISHERIES,
Washington, December 22, 1876.

DEAR SIR: I am duly in receipt of your letter of the 14th of December, informing me of the safe arrival of the salmon eggs in New Zealand. It is, indeed, gratifying to know that such a brilliant success has been experienced; and I trust it may be in my power to assist in having subsequent shipments, not only to New Zealand, but to other points in Australia.

I am in momentary expectation of receiving the announcement of the shipment from Northville, Mich., by Mr. James W. Milner, my deputy, of a lot of whitefish eggs for New Zealand; 500,000 are to be forwarded to San Francisco, of which 250,000 are intended for Wellington, and 250,000 for the California commissioners. To save expense, and to insure greater care of the eggs, I directed that all be addressed to Mr. B. B. Redding, of the Central Pacific Railroad, and fish commissioner of California.

The consignments are to leave at intervals of about a week, so as to avoid the risk of injury to the whole. I have also asked that each consignment be so arranged that it can be divided into two lots of 125,000 each. If, for any reason, as that of the departure of a steamer after the arrival of the first lot and before that of the second, it would be better to take all of consignment number one for New Zealand, I have no doubt that Mr. Redding will consent to it. Of course you will see that all proper precautions are taken for the packing of the eggs on the steamer.

I have, &c.,

SPENCER F. BAIRD,
Commissioner.

R. J. CREIGHTON, Esq.,
San Francisco, Cal.

NAPIER, NEW ZEALAND, *January* 26, 1877.

SIR: By direction of the Hon. J. D. Ormond, the president of the Hawkes Bay Acclimatization Society, I have the honor to address you in reference to a shipment of salmon ova received here on the 12th November last.

The ova were landed from the City of Sydney early in the morning and were at once dispatched by rail to the principal hatching-grounds, 10 miles off, where it was forthwith unpacked.

The ice-chest had been replenished in Auckland, and upon arrival here contained about 7 cwt. ice, the greater part of which was evidently natural ice and must have been part of that used in San Francisco.

A portion of the ova, about 20,000, was dispatched inland about 20 miles farther, to be hatched in a stream rising among the inland mountains. This water was selected on account of the temperature being lower than any convenient stream in this neighborhood. The balance of the ova was placed in a small stream from an artesian well, the boxes being placed about 100 yards from the well.

The ova when unpacked looked remarkably well; the greatest care had evidently been used in packing, and there could not have been more than 2 per cent. dead ova.

Ten days after the receipt the ova commenced to hatch, and within 20 days after arrival the whole of the ova had hatched with the exception of about 3 per cent., which died after unpacking.

The other portion, although placed in what was in November colder water, did not succeed, principally, I think, on account of the water varying so much in temperature; for although for weeks previous to the arrival of the ova the water had been colder than with us, it had not remained so, and, being exposed to the sun for a considerable distance, it had become too warm after the fish commenced to hatch. After the ova that had been detained had hatched it was ascertained that our boxes were too small; we therefore put in a small race, fed directly from the well, where the fish had more room and the water about three degrees less than the hatching-boxes; here they progressed very well. It is estimated that over 30,000 fish were successfully hatched.

On December 13, the fish having nearly lost the sac, the work of distribution commenced, and although it has been a most laborious work I am happy to inform you that the casualties have been very small. The fish have been placed in the headwaters of our principal rivers, which are fed from streams rising among snowy ranges, the temperature being from 56 to 62 degrees. They have been conveyed over very rough country by bullock-drays and pack-horses, and in some cases the cans had to be carried for miles over very rough hills. The fish have now been all liberated, and we can, I think, confidently consider that the experiment has been eminently successful.

I am desired by the Hon. Mr. Ormond to convey to you and the officers of your department, and through you to the Government of the United States, our very high appreciation and hearty thanks for the liberal donation of ova and the trouble you have taken in an experiment which there is every reason to believe will result in the stocking of our rivers in a few years with the king of fish.

I have the honor to be, sir, your most obedient servant,

F. SUTTON,

Hon. Secretary Hawkes Bay Acclimatization Society.

Hon. SPENCER F. BAIRD,

Chief Commissioner of Fisheries, Washington, U. S.

COLONIAL MUSEUM, WELLINGTON, *February* 8, 1877.

SIR: I have the honor to report the receipt of the case of whitefish ova, referred to in Mr. Creighton's letter of the 3d January, and to inform you that, in accordance with your instructions, it was sent on to the secretary of the Acclimatization Society, to whom I telegraphed, so that he might take delivery of it at Lyttelton.

From Professor Baird's letter of the 22d December, it appears that this case contains 125,000 ova, or one-half the total number that were ordered, and that the remainder is to follow by next mail-steamer.

I opened the outer case and ascertained that there was a sufficient quantity of ice round the inner box to maintain the ova at a low temperature until they reached the hatching-ponds, and, so far as I can judge, the shipment has been successfully conducted up to this point.

As the rearing of the young fish will be attended with some difficulty, and require different treatment from that adopted for the young salmon and trout, I have extracted the information in the inclosed memorandum for the guidance of those who conduct the experiment, chiefly from the Reports of the United States Fisheries Commissioners.

I have, &c.,

JAMES HECTOR.

The Hon. the COLONIAL SECRETARY.

[Inclosure in last letter.]

Memorandum respecting the American Salmon and Whitefish, recently introduced into New Zealand.

1. CALIFORNIAN SALMON (*Salmo quinnat, Richardson*).

This fish has been placed in the subgenus (*Oncorhynchus*), which differs from the true *Salmo*, in having more rays in the anal fin.

In habits and general form it closely resembles the *Salmo salar* of the Atlantic, and it is probably identical with the North Pacific salmon, *Salmo* (*Oncorhynchus*) *lycaodon* of Pallas (Gunther, vol. vi, p. 155).

The most important difference from the Atlantic salmon is its endurance of much higher temperatures at the period of spawning, as the eggs are matured in the summer and hatched in the autumn of a mild climate, instead of being developed during a rigorous winter, and hatched out in spring.

The Californian salmon spends the greater part of its life in the sea, and especially frequents deep-water inlets.

There are three "runs" of this salmon up the rivers in each year. The first is in spring, during March and April, when the prime fish, of largest size and best quality, after frequenting the estuaries in large numbers during the winter months, start up the rivers, the full-grown fish working up to the source of the streams, where they spawn in July and August. So far as yet observed, the adult fish all die after spawning, and never return to the sea. In August there is a second run of fish up the

rivers, but at this season they are of inferior quality. The third run is of smaller-sized fish, in the month of October, just before the winter sets in. There are no salmon in the rivers during the winter months from November to March, at which season they are caught in the sea.

The young fish hatch out in October, after sixty days' immersion, when the water has an average temperature of 48° to 50° F., but after forty-eight days' with an average temperature of 58° to 60°.

It has not been ascertained where the young fish spend the winter months. It is an important fact that in ascending to the breeding-place the gravid fish must frequently pass through river water having a temperature of over 76°.

The average size of the full-grown salmon in the Sacramento River and its tributaries is about 20 pounds weight, but fish weighing from 40 pounds to 50 pounds are not uncommon. It is a large, handsome fish, with silvery scales, and a deeper body and less delicate look than the salmon of Europe, but in quality as food they are quite equal to it. When in prime order their flesh is firm, sweet, rich, juicy, and high-colored. As a game fish they are active and powerful, and are freely caught with hook and line in salt and brackish water. In fresh water the best bait is salmon roe, but they also give good sport with the artificial fly. The climate of the upper tributaries of the Sacramento River, where the best salmon-fishing in California is found, closely approaches to that of the New Zealand mountain valleys. The winters are mild, a very little snow falling occasionally with the rains. The days in summer and autumn are hot, but the nights are cool, there being a great range of temperature in the twenty-four hours. Thus, in September (corresponding to March in New Zealand) the thermometer has been known to rise from 55° at sunrise to 100° at noon.

The foregoing observations indicate the *Salmo quinnat* to be well adapted for thriving in the seas and rivers of New Zealand, and the success which has attended the recent shipment of ova shows that a few large importations would, in the course of a few years, thoroughly stock our waters, and introduce a lasting and remunerative industry, as it is from this species that the chief supply of preserved salmon is now manufactured. The consumption of this article in New Zealand and the Australian colonies in one year, as shown by the import returns for 1875, was very large, the New Zealand share having a value of £10,000. The business of canning on the Pacific coast has now reached enormous dimensions. In 1875, 16,000,000 pounds of canned fish was prepared for exportation, and last year seventeen cannaries were at work, though not fully employed, owing, however, to a deficient supply of fish, and not to any falling off in the demand.

2. WHITEFISH.

The species of whitefish, the ova of which are now being imported, is the *Coregonus albus*, the most valuable of a large number of species of

that genus, which are distributed throughout the fresh-water lakes and streams of the Northern Hemisphere between latitude 46° and the Arctic Circle. The representatives of the genus in Britain are the *vandace* of Loch Mabin and Lake Windermere, the *powan* of Loch Lomond, the *pollan* of the Irish lakes, and the *gwyniad* of certain lakes in Wales.

In America there are several species, some of which ascend rivers from the sea, while others, of which *Coregonus albus* is one, are chiefly confined to lakes. The American commissioners express the opinion that few fish will better repay efforts for their multiplication than this whitefish, and large sums are being spent in the propagation and introduction of this species to the various northern and winter stations, where they are not found naturally.

The excellence of the whitefish as an article of food is described by all travelers in the northern regions of America, where it forms the staple diet of the Indians and trappers during a large part of the year. It is a plump-bodied fish, free from small bones, with firm, delicately-flavored flesh in large white flakes. It is highly nutritious, but at the same time free from the rich oil which renders the salmon so cloying to the appetite when constantly used as food.

The size of the full-grown fish is pretty uniform if caught in the same locality; but in some places they reach a weight of 20 pounds, and even 40 pounds, while in others the average is about 2 pounds weight, the difference being no doubt due to the paucity or abundance of their favorite food, which consists of small crustaceans and shell-fish. They grow rapidly, the weight increasing about ¾ pound for each year's growth, the fish of the first season, or about eighteen months old, generally weighing 1¼ pounds. They are very fertile, the number of eggs deposited by the female being about 10,000 for every pound-weight of fish. They have the great advantage of being in season and procurable at all times of the year, although they have regular migrations from the shallow to the deeper waters of the lakes, and to the shoals at the outlets of the lakes for the purpose of spawning. This takes place in the month of November, or just before the winter sets in. At this time the temperature of the surface water is about 43° in the larger lakes. When owing to the shallowness of the water in which the ova are deposited the temperature falls to 34° to 35° during winter, they do not hatch out until April, but the usual period is 100 days between the spawning of the ova and the emergence of the young fish.

In the case of the ova recently imported, the period seems to have been under 80 days, as they were spawned about the 15th November, and the young fish hatched out in Christchurch on the 3d February, which goes to prove that the low temperature in their native waters only retards the development of the ova, and that it is not essential that they should remain dormant for so lengthened a period. This is a very important question as affecting the propagation of this fish in New Zealand, as, if the continued low temperature of the great lakes of North America

is essential, there is no lake in New Zealand where there is a chance of this fish being successfully reared. But if the absence of the extreme cold will only lead to a more rapid development of the embryo, there is no reason to doubt that some, at least, of the larger and deeper lakes, such as Wakatipu and Wanaka, and especially Te Anau, will prove suitable. The waters of Lake Erie attain a surface temperature in summer of 75°, at which season the whitefish return to the cool, deep waters; but in other lakes, which are deeper and without undercurrents, at that season the whitefish run to the shores, and especially to the entrance of rapid rivers, or a broken, rocky coast, where the splash of the waves favors more thorough aeration of the water.

The surface water of the above-mentioned New Zealand lakes has rarely a higher temperature in summer than 52°. On the 6th instant, Mr. Worthington ascertained the temperature of the embayed surface water at Queenstown, Lake Wakatipu, to be 53° at sunrise and 55° at 2 p. m. In winter I found the surface temperature at the same place to be about 46°, and, although we have no information on this point, it is probable that much colder water is to be found at all seasons in the profound depths of this and all the great lakes of the south, so that, as far as mere temperature is concerned, the whitefish would feel at home, provided the winter temperature on the gravelly banks, where the rivers enter the lakes, is sufficiently low for the proper development of the ova.

It is very desirable, however, that the experiment should be tried under the most promising conditions.

The first shipment having been hatched out at Christchurch, I recommend that the whole of the young fish obtained should be placed in Lake Coleridge as soon as they can be removed, and that the shipment expected by next mail-steamer should be forwarded, with a sufficient quantity of ice, to the Makarewa Ponds to be hatched, and the young fish transferred to the Te Anau and Wakatipu Lakes. As the shipment will, no doubt, arrive, like the last, in one parcel, and the chance of success in the south is so much greater, provided there is a sufficient supply of ice available, I cannot recommend that this second consignment of ova should be intrusted to the Auckland Acclimatization Society.

Their application is for the purpose of stocking Taupo Lake, but I find that the water at the outlet of Taupo Lake only varies from 54° in winter to 63° in summer, which differs so materially from the conditions that control the natural distribution of the fish that there would be very small chance of their thriving.

The chief difficulty in propagating the whitefish arises from the circumstance that the ova are coated with an adhesive mucus* that renders their manipulation more difficult than in the case of salmon ova. The young fish are also more difficult to rear, and it has never been successfully done yet, except by turning them adrift in suitable water at a very

* This is an error. The difficulties in hatching whitefish arise from other causes.

early age to shift for themselves, as their food consists of minute infusoria, or similar diet, that cannot be artificially imitated. The minced meat on which the young salmon thrive so well will not answer for the whitefish, according to the evidence quoted by the American commissioners.

JAMES HECTOR.

COLONIAL MUSEUM, WELLINGTON, NEW ZEALAND,
February 9, 1877.

DEAR PROFESSOR BAIRD: You will be glad to hear of the safe arrival of the first case of whitefish ova, though I fear the experiment in this instance will only be a partial success. This is owing to the new arrangements of the postal service having required a transshipment of the ova at Auckland to a local steamer, which had no ice on board, and was, moreover, bar-bound for several days before she started on her voyage down the coast. The ova were transferred from the ice-house of the large steamer in Auckland Harbor, on the 29th January, and did not reach the breeding-pond at Christchurch for five days afterward. I opened the outer case on the evening of the fourth day, when the vessel called at Wellington, and there still was a small quantity of ice, sufficient to retard the development, I hoped, for twenty-four hours longer. Had the steamer gone straight from Auckland to Nelson, which was the arrangement I anticipated, the ova would have been in the hatching-ponds within forty-eight hours of their removal from the ice-house of the large steamer. As we have no ponds at Wellington, the government decided to intrust them to the Christchurch Society, where they have a very good hatching establishment. The water the ova were placed in is stream water, that springs from gravel, and has a temperature of 56° Fahrenheit. The secretary reports that over 200 young fish have come out, and says they are three-quarters of an inch long (five days old), very transparent, with bright yellow eyes, are very lively, and appear to be doing well.

The Auckland Society wish to get the next shipment for Taupo Lake, but I am afraid the temperature will be too high, being from 57° to 63°. I would rather trust the southern lakes, which vary from 46° to 53°, winter and summer. I will report the further results by next mail, when the second shipment will have arrived. With renewed assurance that your kind attention is thoroughly appreciated in the colony,

I have, &c.,

J. HECTOR.

HON. SPENCER F. BAIRD.

Extract of letter addressed to the honorable the Colonial Secretary.

FEBRUARY 21, 1877.

I also inclose a memorandum of the distribution of the fish from the ponds; and the Commissioners desire me to repeat the information conveyed in my telegram yesterday, that the hatching-boxes are clear and ready for the reception of the whitefish ova mentioned in your letter of the 20th November, 1876.

J. MENZIES.

MEMORANDUM.

Mr. Howard reports that the distribution of fish from the Southland ponds since last report, May, 1876, was as follows:

October, 1876.—Salmon fry hatched from ova received from United Kingdom by S. S. Durham, placed in Aparima River 1,500

Californian salmon fry.

January and February, 1877.—Into affluents of Oreti River, viz:

Stag Creek	3,600
Winton Burn	1,200
Irthing River	8,200

And on 17th February, Mr. Howard reports that he had from 3,000 to 4,000 fry still in the ponds, and would on 20th remove all but about 100, kept for purposes of observation, into the Irthing.

Brown trout (ova).

September, 1876.—To Wellington	1,700

Brown trout (fry).

October, 1876.—To Waimatuku	500
November, 1876.—To Makarewa	125
To Morley	800
To Holmes's Wash Creek	1,000
To Otaupiri	1,500
January, 1877.—To Waikaka	250
	4,175

COLONIAL MUSEUM, WELLINGTON, *February* 28, 1877.

SIR: I have the honor to report the arrival of the second shipment of whitefish ova, and to inclose an extract from Professor Baird's letter on the subject. Before their arrival in Auckland arrangements had been made for supplying half a ton of ice, with the view of keeping the

ova in a low temperature during the voyage down the coast. I have just examined the box, and find that there will be sufficient ice to last for five or six days longer, judging from the quantity melted since the Taranaki left Auckland. This should be quite sufficient to insure the ova reaching the Makarewa ponds on Monday next in good order.

I have, &c.,

JAMES HECTOR.

The Hon. the COLONIAL SECRETARY.

[Inclosure in last letter.]

Extract from Professor Baird's letter to Dr. Hector, dated Washington, January 19, 1877.

Yours of the 13th December is to hand. I hope that the first installment of the whitefish eggs has reached you in good condition. I directed that the entire shipment of three or four hundred thousand eggs should be divided into two lots, so as to insure the greater certainty of the safe arrival of some of them.

Give me timely notice if you want more Californian salmon eggs or those of the whitefish, and I will do what I can to meet your wishes to any extent. The order for salmon eggs should be received by May next.

I have written to Mr. Firth, who announces a satisfactory result of his experiment, that, in the event of extra eggs being called for from Australia, New Zealand, Chili, and the Sandwich Islands, and an extension of operations on the McCloud River being required, I might have to charge a small sum for the eggs themselves; but in any event the amount will be but small.

I shall be delighted to have a good collection of your New Zealand fishes, and hope you will send them duly labeled. Can you not get for us some specimens of the new genus of fish allied to the *Amphioxus*? I believe they are found in Moreton Bay.

UNITED STATES COMMISSION FISH AND FISHERIES,
Washington, April 7, 1877.

DEAR DR. HECTOR: Your letter of the 9th of February has been duly received, and I regret that there was even a partial failure in the eggs of the whitefish. If you can arrange for a better connection for the next season I would be glad to send you more; and should you want any salmon eggs, please advise me by the 1st of July.

I have, &c.,

SPENCER F. BAIRD,
Commissioner.

Dr. JAMES HECTOR,
Wellington, New Zealand.

WELLINGTON, *May* 31, 1877.

SIR: With reference to the offer which you kindly made in your letter of the 7th ultimo, addressed to Dr. Hector, I have the honor to request that arrangements may be made for the transmission to this colony during next season of 500,000 of the ova of the Californian salmon, and 250,000 of the ova of lake whitefish (*Coregonus albus*).

I have, &c.,

G. S. COOPER.*

Professor BAIRD,
Commissioner, United States Fisheries Commission, Washington.

CANTERBURY ACCLIMATIZATION SOCIETY,
Christchurch, March 22, 1877.

DEAR SIR: I have to acknowledge, with thanks, the receipt of your memoranda *re* American salmon and whitefish and add that I am very sorry it did not reach us until the information contained in the last clause relating to whitefish was too late.

It is with the deepest regret I have to inform you that we believe every one of the fish has been lost, although hopes are entertained that some may turn up in our races.

The loss seems to have occurred in the following manner: When they were first hatched out, it was observed, from time to time, that the numbers increased in the lowest boxes, where, after careful watching, the discovery was made that they, with perfect freedom, passed through the perforated zinc placed at the lower end of the box. This has always been found sufficient to prevent our smallest trout escaping; and, having heard of the great weight the whitefish grew to be, it seemed consistent to think, ere the ova reached us, that no other preparation was necessary than had been for trout and salmon, which had been so signally successful in the same boxes the same season. However, experience proved the fact, and fine muslin was strained over the zinc, which for a time had the desired effect; but it was soon found that the food (finely-grated liver) clogged that material, so that it required constant attention—and from close inquiries we find this was given early and late—and the evening previous to the discovery of the loss the curator had attended to them himself. The next morning he found the water overflowing the boxes, and all but six or seven of the fish gone. Search was made for them, a few found dead on the floor of the house, but nothing equal to the number we had in the boxes; so that, as we have a race running through the house, we trust that ere long some of them may turn up.

Much as the loss may be and is deplored, I trust the above explanation of the cause will be accepted with good grace, so that the disaster

* Under secretary of the Government of New Zealand.

may not prevent us from receiving the favor of a similar consignment next season, it being our aim and desire to do all that we can to foster and acclimatize everything useful and of benefit to the general public.

Before concluding, I think it necessary to append my opinion in reference to the ova received, supposed to be whitefish. To this I demur, and can only conclude that some mistake has been made, for the following reason: The eggs were about the size of those from the herring, consequently the inference would be they were too small for so large a fish as described in your memorandum.

I give this for what it is worth, and with the hope that, if the government have been subjected to a mistake, such may be prevented in the future.

The ova received are probably from some such fish as our whiting, of the genus *Clupea*, and not *Coregonus albus*, as supposed.

I have, &c.,

S. C. FARR,
Honorary Secretary.

Dr. HECTOR,
Colonial Museum, Wellington.

GEOLOGICAL SURVEY OF NEW ZEALAND,
Wellington, March 9, 1877.

DEAR PROFESSOR BAIRD: I am sorry to say that we had not much success with our whitefish. The first lot, I wrote you, experienced many delays, and when they reached the hatching-ponds only about 400 fish were saved. They thrived well, but by a telegram just received I learn that they have been all lost; I presume escaped from the ponds. I made better preparations for the second lot, and had half a ton of ice ready at Auckland to bring them down to town. They reached here the third day from the ice-house of the big steamer from which they were transshipped at Auckland, and were, as far as I could judge without opening the box, in good order; at least there was plenty of ice around them. I therefore sent them on to the extreme south, where they will have the best advantages at the great ponds at Makarewa, but unfortunately they had to be transshipped at Dunedin, and the steamer that was to have taken them on got wrecked. This caused a week's delay, and I fear some injuries, for the curator of the ponds telegraphed to-day, "Boxes opened, ova all gone, only black scum left." I will have the matter thoroughly inquired into and inform you. Meanwhile we can only wait till next season. You will be glad to hear that about forty rivers have been successfully stocked with salmon from the December shipment. A glorious success so far.

Ever yours, very truly,

JAMES HECTOR.

Prof. S. F. BAIRD,
Washington, D. C.

COLONIAL MUSEUM OF NEW ZEALAND,
Wellington, April 4, 1877.

DEAR PROFESSOR BAIRD: I am sorry to inform you that the experiments with the whitefish ova have proved a failure for the reasons stated in the inclosed correspondence.

You will notice that there has been a doubt expressed if they were the ova of the whitefish, and I will be glad if you can conveniently make some inquiry and report to me for the satisfaction of the government.

From the account given by Mr. Farr they appear certainly to have been of small size for any species of *Coregonus*. The salmon are going to thrive well, I believe, and will amply repay the trouble you took in procuring them for us. The success is a great contrast to the large expenditure and small results in introducing the British salmon to this hemisphere.

I remain, dear Professor Baird, yours faithfully,

JAMES HECTOR.

Professor BAIRD,
Chairman of United States Fishery Commission, Washington.

[MARGINAL NOTE.—Copies of Mr. Howard's letter and Mr. Farr's letter and Dr. Hector's reply, also copy of report of society meeting at Christ church, and a copy of Dr. Hector's memoranda on salmon and whitefish printed.]

CHRIST CHURCH ACCLIMATIZATION SOCIETY.

An adjourned meeting of this society was held yesterday afternoon at the gardens. Present: Hon. J. T. Peacock, chairman; Drs. Nedwill, Powell, Messrs. Hill, Boys, Carrick, Jameson; Hon. Treasurer Farr; Hon. Secretary Johnstone; Fereday, Haumer, and Blackeston.

The secretary said since last meeeting he had received £20 from the Auckland society, balance of the £70 refund on account of the California salmon ova.

A telegram was read from Dr. Hector, requesting that the majority of the whitefish might be sent to Lake Coleridge as soon as they were fit for carriage; a few to be kept by the society for experimental purposes.

The curator, who was present, said that only about a half dozen of the fish were now alive. He had put some muslin in the boxes in order to retain the food; this had caused the boxes to overflow, and the fish had been thrown onto the floor of the breeding-house. A very general regret was expressed that such a mishap should have occurred, which had all the appearance of having resulted from very great carelessness. The secretary was instructed to telegraph the fact to Dr. Hector.

In reply to Mr. Boys, the secretary said about 200 of these fish had been hatched out.

COLONIAL MUSEUM, WELLINGTON, *April* 5, 1877.

DEAR SIR: I delayed answering your letter about the whitefish until I could look into the matter of the size of the ova, as you seem to doubt if they were whitefish.

The only other lake fishes that breed in the fall are the lake herring, the siscowet, and the great lake trout. The following is a table of the relative sizes of their eggs:

	No. per lb. of fish.	No. per oz. of ovary.
Lake trout (*Salmo*, sp.)	700	300
Siscowet (*Salmo*, sp.)	700	376
Lake herring (*Argyrosomus*)	8,000	8,000
Whitefish (*Coregonus*)	12,000	3,000

The *Salmo quinnat* has very large eggs, but they still average about 700 per pound weight of the fish.

From these figures you will see that the egg of the whitefish is very minute compared with that of salmon or trout, and that the size of the egg bears a remote relation, if any, to the size of the fish.

I am sorry for the failure that has occurred, but will send full information on the subject by this mail to Professor Baird, and seek his advice.

I will particularly request that an inquiry be made into the circumstances under which the ova were collected, so that any doubt may be removed as to unfair or unskilled dealing in the matter.

I have, &c.,

JAMES HECTOR.

S. C. FARR, Esq., *Christchurch.*

CANTERBURY ACCLIMATIZATION SOCIETY,
Christchurch, April 12, 1877.

DEAR SIR: I beg to acknowledge yours of the 5th instant, and to thank you for the kind information therein contained.

The doubt expressed by me in reference to the whitefish was somewhat encouraged by the box of ova received by the late curator, which were a very large size, almost equal to the salmon ova received by the society, and which Mr. Johnson stated to the present curator were the ova of whitefish from America.

Probably the inquiry you suggest will not be without its good results.

I have, &c.,

S. C. FARR,
Honorary Secretary.

DR. HECTOR,
Colonial Museum, Wellington.

SALMON PONDS, WALLACETOWN, *March* 10, 1877.

MY DEAR SIR: You will have already learned the bad state of the whitefish ova by telegram, but, as I believe you take a very great in-

terest in the acclimatization of the American fish, I trust a few more particulars will not prove tedious.

The ova were detained in Dunedin until Tuesday night, when they left by Wanganui, not reaching the Bluff till sundown on the following day, and were opened at the ponds on Thursday morning. I regret to say there was little or no sign of ova having ever been there, except here and there a smear of glutinous-looking substance with a vile smell. No one unacquainted with its original contents could have ever supposed ova were there at all. This is the more strange, that even in the shipment of salmon ova from London by the Mindora, which was 133 days on the voyage, the ova were perfect in form though opaque. I have never yet seen a similar case to the present. This led me to try the moss to see if the destruction of the ova was caused by insects, but a powerful glass showed no signs of insect-life of any kind; the moss, however, has a very strong pungent smell, like ammonia, quite sufficient, I should imagine, to destroy the vitality of the ova; but then, would it have destroyed all form and shape of the egg? There is another peculiarity of the packing, which some people would think sufficient to destroy the vitality—the box was nailed and not screwed. I am not, however, a great believer in the extra sensibility of ova, especially in their forward state; and I have even dropped a newly-taken ovum from some distance on to the ground, and afterward hatched it; and I have reason to believe that all the last salmon ova were taken some days previous to shipment; in fact, I suspect were kept until the fish were visible (about twenty-five days, according to temperature), or I cannot account for the perfect fecundation of the ova sent, and their hatching out so soon; in fact, hundreds of the salmon were hatched and dead on arrival.

With regard to the salmon, you will be glad to hear they were a most unqualified success (with the exception mentioned above). Very nearly 18,000 have now been turned out by the direction of the commissioners, and about 200 kept for observation. All those turned out have been taken as far as possible up the Oreti, and placed chiefly in the five rivers at Lowther. This river (Oreti) should be stocked surely, as all have gone into its affluents. The fish grow very rapidly, and are now 3 inches long, quite as large as English fish at six months old. They are the most active fish I have ever had under my charge. When you have leisure, I should feel much obliged if you could recommend me some trustworthy history of these different American fish, as I do not know their peculiarities; for instance, are they as erratic in their first visit to salt water as English fish, &c.? I should also feel obliged if you could give me Mr. S. Baird's address, as I should like much to give him a little information about the time occupied in transit of the ova to this extreme point, in case the government feel inclined to try other shipments.

If you would care for specimens of the ova of the salmon (American), I have some by me, as also a few of the young fish (in spirits); there is

a very marked difference between both, and the home ova and fish. The young fish rise most readily to the flies thrown to them, whatever the adult fish may do. Should you require any information regarding the fish here, I should always most willingly give it.

I have, &c.,

H. HOWARD.

Dr. HECTOR,
Colonial Museum, Wellington.

[Extract.]

WASHINGTON, D. C., *May* 14, 1877.

DEAR SIR: I am in receipt of your letters of 4th and 5th April, and, with you, regret the failure of the experiment in regard to the whitefish. The suggestion, however, that possibly there was some mistake in the eggs, intentional or otherwise, was enough to produce a slight feeling of irritation, not toward you, of course, but at the person who could imagine that in a matter of this kind any error could or would be committed.

These eggs are all taken in the Detroit River, to which the whitefish of Lake Erie resort for the purpose of spawning. The fish are secured in large seines, and many of them are kept alive for a considerable time before the spawn is removed. There are no *Clupeidæ* in the lakes except a very broad species having no resemblance whatever to the whitefish, and which does not spawn in the autumn.

The suggestion of there being any possible relation between the size of the fish and that of the egg is not warranted at all by the facts. The egg of the cod-fish is extremely minute; that of the striped bass (*Roccus lineatus*), which attains sometimes a weight of 75 pounds or 100 pounds, is not the fiftieth of an inch in diameter. The egg of our whitefish is smaller than that of the European species; a consignment received from Germany of *Coregonus maræna* took every one by surprise from its superior dimensions.

Of precisely the same hatching of eggs as those sent you, millions of young fish have been hatched and safely deposited; and I myself have seen a small number from the same hatching-house and the same stock, having, unmistakably, all the characteristics of the genus *Coregonus*.

I have, &c.,

SPENCER F. BAIRD.

JAMES HECTOR, Esq., M. D.

DUN ALISTER, WYNDHAM, *June* 2, 1877.

SIR: At a recent meeting of the commissioners appointed to manage the Southland Salmon Ponds the following resolution was agreed to,

namely, "That the commissioners, being impressed with the belief that another importation of salmon ova from the United Kingdom is necessary to insure their naturalization in the colony, and being desirous to plant American salmon and other fish in various other rivers and lakes in the colony, recommend that £1,000 should be placed on the estimates with the view of obtaining shipments of salmon ova from the United Kingdom by steamers to Melbourne, and of salmon, whitefish, and other ova from America by the Californian mail-boats."

In accordance with the instruction of the commissioners, I have now the honor to communicate this resolution, and, in doing so, venture to express the hope that the government will place on the estimates for this purpose even a larger sum than that suggested above, in order that more than one experiment may be repeated by the Melbourne boats.

I have, &c.,

J. A. R. MENZIES,
Chairman of Commissioners of Salmon Ponds.

The Hon. the COLONIAL SECRETARY,
Wellington.

WELLINGTON, *June* 14, 1877.

SIR: I have the honor to acknowledge the receipt of your letter of the 2d instant, forwarding a resolution of the commissioners appointed to manage the Southland Salmon Ponds, recommending that further shipments of fish ova should be imported from Great Britain and America; and, in reply, to inform you that the government had, prior to the receipt of your letter, determined to ask for a vote for the purpose in the next session of Parliament.

I have, &c.,

DANIEL POLLEN.

Hon. J. A. R. MENZIES.

DUN ALISTER, *June* 26, 1877.

SIR: I have the honor to acknowledge the receipt of your letter of 14th instant, informing me that the government had, before receiving my letter of 2d instant, determined to ask, in the next session of Parliament, a vote for the purpose of importing fish ova from Great Britain and America; and, after communicating with the commissioners, to express their gratification at the decision of the government.

I have, &c.,

J. A. R. MENZIES,
Chairman of Commissioners of Salmon Ponds.

The Hon. the COLONIAL SECRETARY, WELLINGTON.

WELLINGTON, *July* 27, 1877.

SIR: I have the honor to request, on behalf of the Hawke's Bay Acclimatization Society, that it may be supplied with 50,000 salmon ova out of the quantity which I understand has been ordered by the government.

I should feel obliged if you would issue instructions for the same to be separately packed, in order to facilitate matters on its arrival, it being understood that we pay proportionate share of the expense of transit.

I have, &c.,

F. SUTTON,
Honorary Secretary.

The Hon. the COLONIAL SECRETARY.

WELLINGTON, *July* 28, 1877.

DEAR SIR: I am directed by government to ask you to be good enough to have the next shipments of salmon ova packed, if possible, in cases containing 50,000 ova each, in order to facilitate their transit to the different districts throughout the colony.

The government propose to distribute the ova as follows:

Auckland	2
Napier	1
Nelson	1
Greymouth	1
Wellington	1
Christchurch	1
Dunedin	1
Makarewa	2
	10=500,000

I have, &c.,

JAMES HECTOR.

Hon. SPENCER F. BAIRD.

C.—SHIPMENTS OF APPARATUS TO GERMANY, AND CORRESPONDENCE.

AMERICAN LEGATION,
Berlin, December 9, 1876.

SIR: I inclose a letter from my friend Mr. Von Behr which will explain itself, and have ventured to add a translation of it.

I shall write for instructions to Messrs. Riggs & Co., to pay you any expense you may be at should you be willing to comply with Mr. Von Behr's request to send him hatching troughs, &c. If you send them, they had better be addressed to me to the care of the consul of the

United States at Hamburg, and sent by a Hamburg steamer sailing from Hoboken on a Thursday.

I am, sir, your obedient servant,

J. C. BANCROFT DAVIS.

Professor BAIRD,
Smithsonian Institution, Washington.

BERLIN, GERMANY, *December* 7, 1876.

MUCH ESTEEMED SIR: I have received from you, through the kindness of General Meigs, a letter, dated November 16, 1875, which was much valued by me. If I address you to-day simply with thanks for it, without dilating upon it further, it is because I should like to confer with you upon many circumstances which, at the present, I consider more important.

As temporary chairman of our German Fishery Association, which has, indeed, the honor to count you among its members, I shall probably be called upon, in February, 1877, to make a statement of the great efforts which the United States of North America are making in the matter of artificial propagation of fish, compared with the hitherto small beginnings made by us.

As material for my statement, I have, in the first instance, through your kindness, your letter of March 13, of this year, concerning the appropriation of $17,500.

Besides these, I have—

2. Proceedings of the American Fish Culturist Association.

3. Reports 1874–'76 of the commissioners of the State of New York.

All the above-named through Mr. Robert Roosevelt.

But I do not find in any of these pamphlets exact estimates, which, indeed, do not belong to them, of the amount of money placed by your central government at your disposition, honored sir, as the United States Commissioner; as, for instance—

1. For salary for yourself, and, perhaps, other members; allowance for lodgings, costs of offices, and the like.

2. For means for carrying out your objects; as, for instance, the transportation of shad to California; of California salmon thence to the rivers of the East; the erection of the appropriate buildings in California, &c.; all of which are matters which I have read of with the greatest interest.

Under the circumstances under which this letter is forwarded to you, may I be so bold as to ask, to how much do the sums for all the above amount: A, 1873; B, 1874; C, 1875; D, 1876? Together with these questions of statistics, which I willingly resign if my questions touch upon confidential matters, I should like to make a practical request.

In the "Report of the Commissioners of Fisheries of the State of New York," transmitted February 1, 1875, it is said, page 10, "Mr. Monroe A.

Green has invented a carrying-package, which has now been in use for two years, and which is a very great improvement upon the old method."

My respectful request would be that you would send me, with some objects mentioned below, such a packing arrangement, together with special instructions for its use.

It is further said in the same report, page 34, the hatching-boxes which were substituted in place of the old-fashioned troughs add immensely "to the capacity" of the establishment, &c.

I should be greatly pleased if you would send me such hatching-boxes, one of each approved sort; especially I beg for a Holton hatching-trough, which is so highly approved for your whitefish, and which we would like to use for our species of *Coregonus*; for instance, the *Maraenen*. We have, indeed, a description of it; but a specimen sent to me through your kindness would be very desirable for me. Likewise, I must repeat, a specimen of other approved hatching-troughs, such as are specified on page 34 of the above-named report. Opposite page 4 of the same report is a very lively picture of the shores of the Hudson River.

Since I naturally cannot obtain one from the men represented there, I content myself with the request that you will send me one of the transportation-cans. How many young shad will such a can hold, and what method does the person in charge prefer to keep the fish alive—by means of ice or by bladder-skins—or by frequent changing of the water?

You see that I do not despair drawing the shad hither, but not the American—our *Clupea alosa*. I have the great authority of Mr. Bancroft Davis for saying that our *Clupea* is *almost* as good as your shad. It cannot be quite so good, for it feeds in the North Sea upon the remains only of the treasures of the Gulf Stream, upon whose richest provisions, on the other side, your shad fatten themselves.

I adhere, therefore, first of all, to the propagation of our own shad, and beg for such transportation-cans. The necessary wire chests I have had made here.

In the foregoing I have given you already much more trouble than is allowable, but the attempt is so great, that I must crave permission for one more counsel.

We have, in the Lake of Constance, which we call our South German Sea, the *Coregonus fera*, a fine fish, which is spawning now, and has an incredible quantity of eggs. These eggs are, however, so small that they are the despair of our fish-culturists. Indeed, the hope of propagating them artificially has been quite abandoned in the hatching-houses.

We build now in the Lake of Constance a great *chest of wood*, place in it many *feras* ready to spawn, allow them to spawn in it; and we have the hope that the lake water, which streams in through the small holes of the chest without the possibility of fish of prey entering, will hatch out the eggs in it. Have you experience in this? Would Holton's trough be good?

But I must now control myself and conclude, only pointing out that

advice and implements will be very welcome to me before the end of February, 1877, since at that time I must make the statement, in which I should like to exhibit your communications and what you send. Mr. Bancroft Davis has the great kindness to allow his banker to discharge immediately my debt for the implements, and that they may be forwarded to him here.

I need not say that I hold myself in readiness to do any service in return on the part of Germany.

With the utmost respect, I am, your obedient servant,

VON BEHR.

(Address, Schmoldow Bei Greifswald, Prussia.)

Professor BAIRD,

United States Commissioner of Fish and Fisheries,

Washington.

JANUARY 24, 1877.

DEAR SIR: I am indebted to Mr. J. Bancroft Davis for your interesting communication of the 7th instant, in which you ask for certain information in regard to the operations of the United States Fish Commission. In reply thereto I beg to inclose, in the first place, a letter written by Mr. James W. Milner, the assistant commissioner, who is especially charged with the field-work of the commission. I also send you by mail some pamphlets, which contain, in part, the data asked for by you. I will transmit through the State Department the larger volumes referred to in Mr. Milner's article.

I think we have succeeded in solving the problem of the inexpensive hatching of certain fish on a large scale.

The fact that 10,000,000 eggs of *Coregonus albus* can be hatched in one establishment is only paralleled by the ability of the United States salmon establishment on the McCloud River to hatch at one time 15,000,000 of the eggs of the California salmon.

Before proceeding further in my response, I would mention that the California salmon is a fish which promises a brilliant future to the world, from its rapid growth and its ability to resist extreme heat and cold. A salmon that is not materially inconvenienced by water having a temperature of 80 and 85 degrees Fahrenheit is somewhat of an acquisition, as it can be introduced into waters where *Salmo salar* would perish very quickly. In many instances, where in our ponds in the Eastern States we have had the young of both species together, a sudden rise of temperature has destroyed at once all the *S. salar*, leaving the *S. quinnat* in excellent health.

In an accompanying memorandum I give you the successive appropriations made by the United States for the purpose of fish culture. You will please observe, however, the distinction between the appropriation for inquiry and that for propagation.

By inquiry is meant the investigations in regard to the statistics of

the fisheries of the United States, and their present condition, and into the causes which tend to affect their abundance and scarcity. No portion of this fund is expended for fish culture, being applied more to subjects such as are conducted by the sea-coast commission of Messrs. Mayer & Möbius.

I receive no compensation whatever for my services as commissioner; Mr. Milner and Mr. Stone receive salaries. A small force of three or four clerks constitutes the permanent staff of the commission. Laborers and experts are employed only for the period during which they are engaged. There is no allowance for lodgings, cost of offices, and the like, these being supplied by myself.

I can hardly give you the statement of the cost of the erection of buildings for the commission, of which there are three of more or less permanence; one on the McCloud River, in California, for the *Salmo quinnat;* one on the Penobscot River, in Maine, for the *Salmo salar;* and another on the Grand Lake Stream, in Maine, for the *Salmo sebago* or land-locked salmon. These are all temporary, inexpensive structures; of these the more pretentious one could be erected for $3,000 and the last-mentioned could be erected for $500.

Many additional data will be found in the documents which I shall have the pleasure of sending to you, either by mail or through the State Department.

I have requested Mr. Milner to have made for you at the earliest possible moment such of the apparatus used by the commission as he considers to be of value. Some of the articles referred to are not considered by us important.

I think you will find in Mr. Milner's communication some matters of interest in reference to the *Coregonus*. Mr. Hessel tells us that the eggs of *fera* are smaller than those of the *albus*, but I do not think this fact will prove any hinderance to our experts.*

I had hoped to supply eggs of the land-locked salmon to Germany, but the heavy snows in the interior of Maine have prevented their being brought out for shipping. This species is one of the most brilliant promise, as it is scarcely distinguishable, if at all, from the *Salmo salar*, and is without any migratory instinct. It occupies the small lakes, and furnishes sport to the angler, taking the fly with great eagerness.

I offered also to his excellency some eggs of the California salmon, through Mr. Bartels, the German commissioner to the Centennial Exhibition, but did not get the reply until the distribution had been made.

These eggs are usually ready to be shipped during the first half of October, and I am quite willing to furnish any number of them at the actual cost of collection and expressage to New York, which might amount to two or three dollars per thousand. They are brought east in a refrigerator-car, and could readily be packed on shipboard so as to

* A subsequent comparison of the eggs showed those of the European whitefish to be the larger ones.

retard their development until they reach Germany. By the 1st of November the eggs are large enough to hatch out in the eastern hatching establishments.

Respectfully, yours,

SPENCER F. BAIRD,
Commissioner.

Herr VON BEHR,
Greifswald, Prussia.

WASHINGTON, *January* 19, 1877.

SIR: In replying to the questions you have referred to me, in the letter addressed to you by Mr. von Behr, of December 7, 1876, relating to the artificial propagation of food-fishes, I have preferred to amplify the answers, so that they will include not only reference to the apparatus for propagation, but also the methods employed by our best culturists in overcoming some of the difficulties referred to by Mr. von Behr.

As to the "carrying-package" referred to, it is similar to the one described on page 547 of Part II of your report as the invention of Mr. N. W. Clark. (Part II Report of the Commissioner (United States) for 1872 and 1873 Washington: Government Printing Office, 1874.) Mr. Clark (now deceased) had the device patented. It is not extensively used in this country, as the simpler method of packing eggs described by Mr. C. G. Atkins, on page 263 of the same report, is found to answer the purpose better for several reasons. In the first place, it is absolutely essential in the carrying-package spoken of that it shall not be turned down on its side, as the eggs are not in contact with anything above to hold them in position, and, consequently, fall in a mass to the lower side if too much tipped. By Mr. Atkins's method, the soft moss packing hold them snugly in the same position however the box may be tipped. It also economizes space, and large quantities of eggs are frequently transported very successfully without an attendant.

The carrying-package first referred to was made use of by Mr. Welsher and Green in the second attempt to carry shad to Germany. For this project, which involves the difficult task of carrying shad a journey of twelve or fourteen days, it is perhaps indispensable. The experiment made previous to the voyage proved that the shad ova could be retarded in their development to a period of seven days and then hatched out as vigorous fishes. The purpose was to retard a number of eggs taken immediately before the starting of the steamer until seven days out from land, and then to have a suitable contrivance for the care of the young fishes until they could be placed in the river Weser.*

The apparatus brought into notice by Mr. Atkins, referred to previously, is better adapted for hardy transportable eggs, which those of

* See United States Commission of Fish and Fisheries, Part III; Report of the Commissioner for 1873–'74 and 1874–'75. Washington: Government Printing Office, 1876. pp. xxi, 328, 337.

the shad cannot be considered to be. Mr. Livingston Stone uses it in packing salmon eggs for their long journey from the Sacramento River across the continent to the Atlantic seaboard. Mr. Stone's method of packing the boxes containing the eggs in a large crate, with a space filled with a packing of ferns or leaves and arranged so that a quantity of ice is in contact with the boxes, to be constantly resupplied, is also an important device for the welfare of the eggs in a long railroad journey.

We have used the same means in shipping the whitefish ova (of the *Coregonus albus*) from Michigan to California and to New Zealand.

A few general suggestions, which are the result of observations, as to the condition of eggs when unpacking consignments from distant points, may not be out of place.

The transportation of eggs long distances, as from England to Australia or New Zealand, from the United States to Germany, from Germany to the United States, from the United States to New Zealand or Australia, or even from one seaboard of the United States to the other, has now been repeatedly tried, and, except in the case of a few shipments, with too large a percentage of loss to consider the present methods to be in any great degree perfect.

The conditions necessary to the welfare of the eggs seem to be, avoidance of changes of temperature, snug packing in a soft material that does not compress them, the absence of decaying or fermenting matter from contact with the eggs, and probably protection from severe jarring. Where an attendant accompanies the package, the second condition is not so important, as he will, of course, see to it that the package is kept right side up. Of course, nothing will insure the safety of the eggs more than a competent attendant, as he will see that all the conditions named are constantly fulfilled.

Even where use of the Atkins-Stone method has been employed, a repacking of the eggs at the end of a week's journey would in most instances be beneficial. If there should be no attendant with the eggs, their consignment to a competent fish-culturist en route, or arrangement with the forwarding company to permit some expert to repack them at some point during the journey, would be good management.

To fulfill the first condition named, the packing of the eggs of the species which have been transported in this country, such as the Penobscot or Atlantic salmon (*Salmo salar* Lin.), the California salmon (*Salmo quinnat* Rich.), the Land-locked Salmon, (*Salmo sebago* Gir.), the brook-trout (*Salmo fontinalis* Mitch.), the Oquassa trout, or blue-back, (*Salmo oquassa* Gir.), the Mackinaw trout (*Salmo namaycush* Pennant), the Skaneateles lake-trout, (*Salmo confinis* (?) DeKay), the California brook-trout, (*Salmo iridea* Gibbons), the Utah trout (*Salmo virginalis* Gir.), the lake whitefish (*Coregonus albus* Les.), the Otsego whitefish (*Coregonus otsego* Clinton), is best done in a cold room, where the temperature is about the freezing-point, say between 30° and 36° Fahrenheit. The sphagnum moss should be fresh, and will be better if it shall

have been washed in a tank of running water for several days before use. It should be squeezed, so that the water retained in it will not drip. This is necessary to prevent the packing between the inner and the outer box from becoming saturated, and may possibly also be necessary because of the danger of stale dead water to the eggs. The moss should now be spread upon the bottom of the box to the thickness of an inch when pressed flat. Squares of millinet, from which the sizing has been washed out, should be cut rather smaller than the inside area of the box, and after being moistened with water, laid over the bed of moss. The eggs are now laid upon this in a thin layer not more than two or three deep for whitefish eggs and about three or four for salmon; when they have been distributed equally with a feather, a square of wet millinet is put over them, and upon this a layer of moss of the thickness of an inch is again packed level, the millinet is again laid over the moss, the eggs are put upon it, and so on until three or four layers of eggs are placed. The moss should now be piled up, so that when patted down with the hands it projects an inch or more above the edge of the box, and when the lid is put on and set tight with screws, the eggs are moderately snug and firm in their position from the slight compression of the moss. It is usual to bore a number of small holes in the box.

Thus far they are supposed to be secured from shaking about and from danger of becoming dry. The needful security from changes of temperature is now to be made. Mr. Livingston Stone has devised the best method yet tried in this country.

The boxes, packed as described above, containing three or four layers of eggs, are about seven inches thick. The boxes used for shipping California salmon eggs, by the United States Commission, are about two feet square. Mr. Stone places two of these in a crate, made of strips of pine, large enough to permit a space of about one foot between the two boxes and a space on all sides of them of about six inches. The outside space is to be packed tightly with packing which is the best non-conductor of heat that can be obtained. At the station where the salmon-breeding establishment is, it is the withered leaves of ferns. In the space between the boxes large lumps of ice are put, a plug of the dead leaves being inserted at each end of the space, above and below the ice. One of the strips which make the top of the crate is movable, so that it can be taken out and the plug of leaves removed when the ice is to be renewed. Fifty such crates, containing each 80,000 salmon eggs, have been sent in a car across the continent, a journey of seven days. An attendant accompanied them to renew the ice, which was carried in the car, and the eggs arrived in the very best condition.

The Holton hatching-box, referred to, is figured and described in part 2, of the Report of the United States Commissioner, before referred to, as well as other apparatus which have now generally been substituted for the old-fashioned troughs throughout the United States and Canada. These tray methods economise space very much and give

much better control of the eggs, and some of them of the young fishes, than was possible with the earlier methods.

The Holton box, with the seventeen trays deep, as they are used, does, perhaps, concentrate space more than any other form. The trays applied in a long trough, containing apartments in which are inserted boxes holding the trays, or nest of trays without the box, have, however, some advantages. With the trays only seven or eight deep, the lower ones are, of course, more accessible; but it is after the hatching of the eggs, when the care of the young fishes employs the attention of the culturist, that the great advantages of the compartments in the troughs exhibit themselves. The old way was to remove the fish to nursery tanks, where they were put several thousands together, and where the surplus of the food—liver, or curd, or whatever it might be—sank to the bottom to decay and foul the water and sicken the young fishes. The complaint was not uncommon that the fishes crowded in masses to where the fresh water fell into the tanks and were at times seemingly smothered. In the trough apparatus a box, having a wire-cloth bottom, is inserted in each compartment, and the fishes, hatched upon the trays of another box, are emptied into it. After a few days' feeding, in order to cleanse the box containing the fishes, they are removed to a tray and the box thoroughly washed. The larger pieces of curd or liver can be picked away from among the fishes, and they can then be returned to the box until it is again necessary to repeat the operation.

In the case of the California salmon, Mr. F. N. Clark, who used this method in connection with his apparatus (see Report of the United States Commissioner, part II), finds that it requires nearly four times as many of the boxes, open, to contain the living fishes as it does of the eggs and embryos on the trays. Thus, while about forty-five hundred to forty-eight hundred young embryos lie upon the seven trays within a box, only about twelve or fifteen hundred young fishes should be put in the same open box* where the fishes are fed.

A very neat and convenient apparatus has been invented by Mr. T. B. Ferguson, fish commissioner of Maryland. It consists of a simple glass vessel, with an opening on one side, near the bottom, for the entrance of the water, and a smaller opening on the outside, near the upper edge, for the escape. In the vessel is a series of nine or ten trays of wire-netting, one above the other. The eggs lie on these trays and the water passes upward through them to the place of exit, near the upper edge. Several of these vessels can be combined by means of rubber tubes, when the water, being introduced from a cock into the first, passes through the entire series. Many thousands of eggs have been hatched out by this means at the Druid Hill breeding establishment in Baltimore. A description of the apparatus, with figures, can be found in the report of the fish commissioner of Maryland, made to the house of repre-

* The dimensions of the box are about 14 inches by 9 inches, with a depth of 8½ inches.

sentatives, January 1, 1876, Annapolis, Md., John J. Wiley, State printer, p. 48.

It will be seen that, by the tray methods it is not necessary to pick over the eggs within the troughs, but that they may be removed to a more convenient position. The way adopted by Mr. Clark, and now coming into general use, is to have a shallow picking-trough, with a flow of water of less than one inch depth, usually placed directly in front of the windows along the side of the house.

The later experiments in this country are, however, in an entirely different direction. So far, of course, they have not had the years of use which establishes the success of the tray method.

The initial move in the direction of hatching eggs *en masse* is of course the shad-hatching box of Seth Green. This is peculiarly adapted for shad, and is restricted, of course, to the open water during the warm portion of the year, and precludes the hatching of such fishes as are developed during the cold of winter. It also assumes it desirable that the eggs shall be kept in motion, the inflow of water raising them gently each time they fall back toward the bottom of the box.

The first attempt to adapt this idea of hatching eggs in bulk, instead of layers, on the inside of a hatching-house, was made by Mr. Fred. Mather, while in the employment of the United States Commission Fisheries. With the aid of Mr. Charles Bell, also of our corps, he devised a funnel-shaped apparatus, with the water introduced from the small end passing through a strainer of wire-cloth at the bottom of the funnel upon which the eggs fell, to be immediately, though gently, carried upward by the current of water, until, when near the top, they fell over to the sides of the funnel and rolled downward, to be again carried upward when they touched the stronger portion of the current. With this apparatus, a quantity of shad eggs was successfully hatched in the wash-room of a hotel.

The apparatus was described and figured in Forest and Stream of New York, in 1875, and will appear with a description in the Report of the [United States] Commissioner of Fisheries, part III, soon to be published.

Mr. Oren M. Chase, employed by the Michigan commission, has devised two or three forms of apparatus, one of which promises to be not only an effective but a beautiful and attractive apparatus.

In this arrangement the eggs are impregnated, and put into the vessel in large quantities, and thus left entirely to themselves, the dead eggs rapidly becoming light, in the process of decay float up and out of the vessel. The current of water among the moving eggs keeps them clean and bright, although the water used is perhaps fuller of silt and sediment than that of any other hatching-house in the United States. If this process answers the purpose, as it seems to have done the past two seasons with small quantities of eggs (50,000 eggs of *Coregonus*

albus Les.) in a three-quart vessel, it will revolutionize the methods of hatching, and economize labor as well as space.

Experiments are being made with modifications of these apparatus, referred to, at the Wisconsin hatching-house, by Mr. H. W. Welsher, and in the Canadian establishment at Sandwich, Ontario, under Mr. Samuel Wilmot.

Mr. Livingston Stone, of the United States commission, has used an apparatus which he calls a "basket" for the California salmon eggs. He places them in a coarse wire-cloth basket, suspended from a square wooden frame inserted in the compartments of the Williamson troughs (see part II, Report of the United States Commissioner); eggs in bulk to the amount of three or four quarts are placed in these, and have been carried through successfully. The basket, by a few slight yet quick movements, has the eggs turned over, so that the dead ones may be picked out. For the larger fish-eggs this may answer a good purpose. As it affords the opportunity of keeping young fishes in the compartments, as before described, its efficiency should have a further trial.

Mr. Von Behr speaks of the eggs of the *Coregonus fera* of Lake Constance, as "the despair of our fish-culturists." Having witnessed the great difficulties encountered in the first attempts of fish-culturists to propagate the whitefish of the great lakes (*Coregonus albus*, Les.), it is readily understood what it must be to hatch the eggs of the species referred to, which Mr. Rudolph Hessel informs me are about one-half the size of the eggs of the American species.

It is not too much to say that no American culturist has fully tested his skill and ability in his profession until he has succeeded in hatching seventy-five or eighty per centum of a fair quantity of whitefish eggs. In delicacy and sensitiveness they exceed all species handled in this country.

The history of the beginning of this enterprise is given on page 25, of Part II, Report of United States Commissioner. Since that time, with the use of the tray methods, the work has become very extensive along the lakes. This winter, 1876–'77, there have been placed in the hatching-houses of Ohio, Michigan, Wisconsin, and Canada about twenty-seven millions of the eggs.

At some of the establishments the fatality is very large; at a few, it does not reach 25 per centum. The principal point to be regarded, after well impregnated eggs have been laid down on the trays, where the supply of water is suitable, is the removal of dead eggs. An evenly-sustained low temperature, in the neighborhood of freezing, is undoubtedly best. To call attention to the necessity for the removal of dead eggs may seem a very unnecessary caution to the careful culturist. But the usual routine and force in a hatching-house, caring for the eggs of members of the genus *Salmo*, is found to be quite a different matter from the work required with these sensitive eggs. They will need attention very

soon after being put into the trays, and the force of egg-pickers should be increased to whatever extent is necessary to pick the dead eggs from each tray every second day, until the fatality decreases or the unimpregnated eggs have been removed. The neglect of a day or two finds the eggs matted together in bunches by the outreaching *Achlya prolifera*, and the loss becomes great. Continued care and attention that the trays and eggs be kept clean and free from the confervoid is essential. Little success can be expected from the old-fashioned trough, where it is impossible to clean the gravel after the eggs are put in.

The Clark, the Holton, and the Williamson apparatus are all used along the lakes for the whitefish work.

On page 443 of Part II, Report of United States Commissioner, will be found a full description of the transportation-cans and the mode of using them in the transportation of shad.

I believe I have now replied to all the inquiries made by Mr. Von Behr with reference to matters of fish propagation.

Yours, respectfully,

JAMES W. MILNER,
Deputy United States Commissioner.

Prof. SPENCER F. BAIRD,
United States Commissioner of Fish and Fisheries.

D—ADDRESS MADE AT THE MEETING OF THE GERMAN FISHERY-ASSOCIATION AT BERLIN, MARCH 16, 1877,* BY MR. VON BEHR, SCHMOLDOW, PRESIDENT OF THE ASSOCIATION, MEMBER OF THE GERMAN PARLIAMENT.

GENTLEMEN: A disagreeable word demands admittance at the gates of Germany, as it does in most of the states of Europe, and this word is "*Depecoration.*"†

This word which has unfortunately been adopted by our language, I call disagreeable, not merely on account of our postmaster-general, but chiefly on account of its meaning; for it means, that the number of those quadrupeds whose flesh supplies food for man is decreasing both absolutely and relatively if compared with the increase of population. It can easily be calculated what this means in Germany, where the number of the before-mentioned animals is decreasing at any rate. Let us count fifty pounds of meat annually for each of the forty-two millions of inhabitants of the German Empire—and this is certainly a very low average—and we get a total of 2,100,000,000 pounds of meat consumed by the population of Germany in one year. But as the average annual increase of the population has been 400,000, the quantity of meat ought

* From circular No. 3, of the German Fishery-Association, Berlin, March 21, 1877.

† From *de* privative and *pecus-oris* a herd or flock. The reference to the postmaster-general, is a humorous allusion to his prejudices as a purist.—ED.

every year to increase twenty millions pounds. Gentlemen, I think that in view of this increasing demand, the word "depecoration" has a threatening sound; for we cannot take into consideration the circumstance that the demand for meat has been temporarily diminished. This is only a period of transition, which, trying as it may be to our beloved country, has no bearing on the great question of permanently supplying sufficient and nourishing food.

Gentlemen, should we not in view of this "depecoration" remember the words of Frederick the Great, the illustrious ancestor of our Royal Protector, calling that man a benefactor to his country who made two ears of corn grow where formerly only one had grown? Should we not in our time ask, Who will double the production of meat? Gentlemen, as soon as we will count fish among the *Pecus*, we need not fear any "depecoration," but we have only to say, "Germany expects every pisciculturist to do his duty."

Gentlemen, the number of eggs annually produced by fish is countless—nothing need be said about this here—but countless are likewise the fierce enemies of the spawn—therefore, let the spawn be protected; let the young fish be protected during the first tender stage of their existence; this is so easy in theory; and, gentlemen, let only a greater interest in pisciculture be awakened among the more educated classes in Germany than there has been felt hitherto, and a magnificent result cannot fail to be obtained. Shall I mention China as an example? No, rather the United States of North America, from which we have documentary proofs of the most perfect success of the efforts made by pisciculturists. As I am about to lay before you these results from across the ocean, my heart is filled with admiration, but likewise with a feeling which I will not term envy, but a strong desire that we in old Germany might emulate these efforts, and obtain similar results as far as our natural conditions make this possible.

You will permit me to preface my remarks with a brief theoretical observation.

In our country the *salt-water fisheries* can contribute a considerable share toward increasing the quantity of food by bringing more fish into the market. The pasture-grounds of the North Sea are inexhaustible. Although London alone receives from the North Sea at least as large a quantity of fish as the quantity of beef which it consumes (about 900,000 tons of twenty hundred-weight annually), not to mention the large quantity of other food with which the North Sea supplies the great city, this does not in the least diminish the wealth of these waters, which England alone enlivens with 1,900 fishing-vessels. Germany might likewise reap much greater benefit from these waters.

My subject does not permit me to enter into details, but this I must say, and address my words, as I hope, to persons of influence: Our railroads might well have the *nobile officium*—possibly for many years at a sacrifice—to further the introduction of salt-water fish into the great

inland markets. Let us hope that they will do this and do it soon. At the present time Berlin would be thankful for every pfennig taken from the price which the railroads charge for transporting a pound of fish.

Gentlemen, it gives me special pleasure to be able to inform you that yesterday the board of directors of the North German Private Railroad have taken the first praiseworthy step in this direction.

At a conference to which I and Mr. Lindenberg, a wholesale dealer in fish, were delegates from the German Fishery Association, they unanimously passed a resolution to reduce the charges for shipping fish on their lines to the amount which they had allowed five years ago at the urgent suggestion of our association, but in consequence of the hard times had again been raised.

This reduction amounts for Berlin to two to three pfennings per pound, a difference which will be greeted with joy by the lower classes of our large population.

It is a pleasant duty for me thus publicly to express in the name of our association our best thanks to the board of directors of these railroads for the kind manner in which they have met our wishes.

Besides those fish which are caught in the ocean, where of course there can be no attempt at pisciculture, where man reaps without sowing, the *fresh-water fish*, of such vast importance for Germany, must not be forgotten. How could we forget our Lake of Constance, the Madue Lake, the Schaal Lake, the 500,000 acres of lakes which the one province of Prussia contains, our numberless rivers and ponds? Modern civilization has done much injury in this respect, an injury which can scarcely be remedied.

To-day it is my chief object to speak to you of the *migratory fish*, which open by far the largest and most important field for our piscicultural efforts, as long as these fish, impelled by an irresistible natural desire, leave their pasture-grounds in the ocean and ascend into our rivers and into our nets.

Has the quantity of fish in the ocean decreased since those times when, according to well-authenticated reports countless schools of salmon ascended our rivers? Has the desire to migrate diminished in these fish? No; man's greediness has prevented the fish from ascending to their spawning places, or poisoned the water, or ruthlessly caught the young fish; but I will not call to mind these evils, but too well known.

Piscicultural efforts must therefore be directed to the migratory fish, and then to the fresh-water fish.

Allow me to tell you what during the last few years has been done in this direction in North America. The words with which Mr. Robert Roosevelt, commissioner of fisheries of the State of New York, opened the meeting of the fishery association are indicative of the results which have been obtained in America. He said, "It gives me great pleasure to see that there is everywhere a constantly increasing interest felt in

pisciculture. Progress is noticed everywhere; no failures; success in every direction."

Gentlemen, figures prove that these proud words rest on a firm foundation.

To begin with the division of labor in America, we must mention, first of all, a man who deserves the highest credit for his efforts, Professor Baird, of Washington, who is at the head of the central or government commission. I feel it a pleasant duty to express to him on this occasion the sincere thanks of the German Fishery Association for the great liberality with which he has given aid to our association. Might these feeble words of mine reach him across the ocean.

Although the individual States of the Union displayed a great and praiseworthy activity in the matter of pisciculture, the necessity of having some central authority or board was soon recognized, in order to superintend the whole of that immense territory. Professor Baird was therefore, in 1873, appointed United States Commissioner of Fish and Fisheries, and immediately set to work on a grand scale. He considers his office as an honorary one. During the first three years the average sum annually allowed him for pisciculture, was $25,000; but with his success his means likewise increased, and during the last two years he has had an annual appropriation of $47,500. Through his kindness I have in my hands his petition to Congress, of March, 1876, in which he asks for an appropriation and gives his reasons for the same. As the chief objects of his efforts he mentions the shad, the fresh-water herring, the California salmon, the beautiful whitefish (*Coregonus*), and the carp. He lays special stress on the fact that the central commission does not meddle with those duties which belong to the province of the individual States, and which they can easily fulfill. But when in a region of their vast territory in California, a new kind of salmon was discovered preferable to our Rhine salmon*, which does not succeed very well in America, Professor Baird was at once on hand; and his distinguished agent, Mr. Livingston Stone, founded a large establishment for hatching salmon eggs, from which during the first year 5,000,000 eggs were distributed over thirty-two States of the Union; in the following year 11,000,000 eggs were distributed, and in the next year 7,000,000. The labor of the last year, which thus yielded 7,000,000 salmon, involved an expense of $10,000. Mr. von dem Borne has some time ago published a charming picture, showing Stone's enterprise in founding the hatching establishment among the savages.

Recently Professor Baird has discovered a new kind of salmon which is non-migratory and has the most delicious flavor, and with his wonted liberality has offered us eggs of the same.

Professor Baird's next object was to draw up a plan of campaign, having in view the introduction of the shad into every river from Florida

* The Atlantic Salmon (*Salmo salar.*) In the following sentence the statement should be changed so as to read—"Does not succeed except in the northern portion of America."—Ed.

to Connecticut. Many of the rivers have been depopulated by reckless fishing, and did not afterward regain their stocks of shad, a sure proof that this fish, like other migratory fish, always returns for spawning to the place where it was born. These depopulated rivers had therefore to be stocked again.

As a proof of the gradual depopulation of the rivers by reckless fishing, Professor Baird mentions that at present from six to ten million pounds of shad and herring are every year caught in the Potomac, while in 1835 630,000,000 pounds of these fish were caught during the six weeks of the fishing-season. He says: "Who can doubt that the ocean is as well able to-day as it was then to send such quantities of fish into the Potomac, and in proportion into all the rivers in the neighborhood?" and concludes his report with a statistical table, according to which his commission has during the last three years distributed 40,000,000 of impregnated fish-eggs and young fish.

Gentlemen, these are proud figures; but we would be very much mistaken if we thought that this was all the result obtained in America. Allow me to anticipate my report. The small State of Connecticut, about the size of Mecklenburg-Schwerin, has alone of shad placed one hundred million in the proud river whose name it bears.

I will in this connection say something regarding the shad, of whose cultivation the Americans are justly proud. This fish belongs to the herring family (*Clupeidæ*), the most prolific of all the migratory fish. As soon as the temperature rises in spring, these fish leave their incomparable pasture-grounds in the Gulf Stream in order to spawn in the rivers during the months of May and June. After three to five days the little fish leave the eggs; and as they have scarcely any umbilical bag, they can immediately, from the very ingenious hatching-boxes invented by Seth Green, be transferred to the rivers. How easy does this process seem if compared with the raising of the salmonoids which require the care of the pisciculturist for three and four months. The shad is, besides, a very excellent fish, highly prized for the table of the wealthy, but also within reach of the poorer classes, as, thanks to the efforts of pisciculturists, its price has fallen again. The only objection to it is this, that its fishing-season only lasts about two months, because immediately after spawning it returns to the ocean. Recently, however, the efforts to domesticate it in Lake Ontario seem to have proved successful, and it might there be caught all the year round. I shall return to the shad.

Besides the central commission, a piscicultural association has been formed, with Mr. Robert Roosevelt as president, to whom we are likewise under many obligations. This association does not disburse any money for fish propagation, but merely gathers together the commissioners of the individual States, in New York,* for the purpose of ex-

* The meetings of the American Fish Culturists' Association assemble all who are generally or specially interested in these subjects and desire to become members, and are not for commissioners only.—ED.

changing ideas and making new experiments. I shall quote many things from their reports, which I hope may be useful in Germany.

Thus, Mr. Seth Green reports that recently he has paid special attention to the grayling, and that he has traveled thousands of miles in the West in order to bring this valuable fish to the New York hatching establishment, and that his efforts have been completely successful. But the raising of shad is the subject on which Seth Green dwells with special enthusiasm. He delights in relating how, in the year 1868, he had asked Congress for a small financial aid for his experiments, but how he was peremptorily refused, and repeatedly considered insane. Now, when hundreds of millions of shad are hatched in the boxes invented by him, the price of shad in the Hudson has already fallen to 20–25 pfennige apiece, which is about 8 pfennige per pound, and about one-third of the price paid twenty years ago.

But Seth Green is not yet satisfied with this, for in the Connecticut River, in which 100,000,000 young shad had been placed, there were recently caught in one net 3,560 shad, more than were ever caught at a single haul during this century. The annual yield there has also been greater than at any time since 1811, and the price for 100 fish has therefore been $3, scarcely 4 pfennige per pound. Seth Green also succeeded four years ago in shipping his young shad from New York to California, and large shad recently caught in that State, where formerly not a single one had been seen, prove that the experiment was a complete success.

Besides his efforts in the line of shad-raising, Seth Green reports splendid results in raising whitefish. This very excellent fish belongs to the genus *Coregonus*, and is about the same as our Lake Madue *maræna*.

At the request of the State of Michigan, Seth Green sent (according to his report to the above-mentioned piscicultural association) one of his assistants to that State, with the so-called Holton apparatus, which he considers the greatest piscicultural achievement of modern times. Eight such apparatus, placed side by side in the hatching-house, only occupy a space 16 feet long and 3½ feet broad, and can at one and the same time hold at least 2,000,000 *Coregonus* eggs. At the suggestion of Mr. Von dem Borne, I have asked Professor Baird for such an apparatus, which, with his characteristic kindness, he has sent me immediately. According to the opinion of American pisciculturists, this is the first apparatus by which a very large number of the finer kind of fish can be raised with very little expense. Might this apparatus also prove successful with us!

Equally with the Holton, the Clark apparatus is considered the best; both of which you see before you, as well as a number of other implements used by American pisciculturists. We indulge in the reasonable hope that they will also prove useful in this country.

Well, gentlemen, with this apparatus there was actually raised for

the people of Michigan 8,000,000 of fine fish, all destined for Lake Erie; and it is the intention to continue the work on this scale, and thus to place 32,000,000 fish in this one lake.

Gentlemen, these are magnificent results; and remember with what ease these milllions of young fish were called into existence. I certainly do not aim at anything too difficult, if I say to our German pisciculturists, "We *must* do the same."

Besides these great and chief efforts, there are all sorts of little side efforts to which American pisciculturists give their attention—Seth Green, it seems, always prominent. Thus, during the summer of 1875, attention was directed to the sturgeon. Gentlemen, you know this great fish. Its flesh is not particularly tender, but very nutritive; "Albany beef" they call it in America. However, the main question is, how to produce cheap food for the masses. Seth Green, on the 4th of June, went to New Hamburg, on the Hudson, a well-known spawning-ground of the sturgeon, took from a female sturgeon five dishes-full of eggs, from a male sturgeon the necessary quantity of milt, placed the eggs in a shad-box in the river, and behold, after three days, 40,000 young sturgeons were hatched. It might have been a million, for a large sturgeon has so many eggs. Gentlemen, could we not attempt something like this during the coming June? Where could we find better opportunities than in Magdeburg, in Schleswig-Holstein, in East Prussia? O, might these feeble words of mine produce some action in this direction! I shall always be ready to make communications from the American reports.

Once more I turn to America, to give a cursory review of the work done in some of those nineteen States which have fishery commissioners of their own.

I have already mentioned how the shad was domesticated in California. The same result crowned the efforts made to introduce the *Coregonus* in that State, and all accomplished with a few thousand dollars.

The State of New York seems to take the lead in pisciculture. In the last report of the New York commissioners it is said that the State hatching-house gratuitously distributes to all who desire young fish for public waters, salmon, salmon-trout, whitefish, and different kinds of perch. This institution has recently been considerably enlarged, so as likewise to raise brook-trout. Although several millions of young fish had been gratuitously distributed, there remained in the institution March 1, 1876, one million trout and three million salmon-trout.

Connecticut, not satisfied with its wealth of shad, likewise put millions of young salmon and salmon-trout in its rivers. All this involved an expense of about $30,000. The flourishing condition of the Connecticut fisheries is chiefly ascribed to the strict fishing-laws, and particularly to the weekly season when fishing is prohibited.

Maine chiefly devoted her attention to fish-roads. Massachusetts aims at increasing the number of fresh-water herring, but also placed

in her rivers from five to ten millions of shad and salmon per annum, and has, during the last eleven years, spent $40,000 for such efforts. Michigan has placed one million and a half of the finest *Coregonus* in more than two hundred of her lakes, and millions of shad in her rivers. Not contented with this, a new hatching-house has been erected, in which, at the date of our report, there were eight million *Coregonus* eggs.

A great many interesting facts might be gleaned from the reports of the other States, but time forbids to enter into details. I will only mention that everywhere, at an annual expense of a few thousand dollars, the fish commissioners, who invariably consider their office an honorary one, have obtained great results. The American pisciculturists, above everything, lay great weight on the necessity of fish-ways, and of a weekly season of 24 to 36 hours when fishing is absolutely prohibited.

This, gentlemen, also applies to Germany, and I shall now make a few remarks on our German piscicultural efforts.

I am far from ignoring the progress which we, too, have made during the last five years: we have in Prussia a good fishing-law, and soon expect to get the necessary regulations, seasons and places of prohibition, and salmon-ladders; we have placed several millions of young salmon in nearly all the German rivers, the results being already visible; that the sunshine of public favor is more and more directed to our efforts; that at the present moment we possess more than one hundred and fifty piscicultural establishments, many of which have displayed a very liberal spirit by gratuitously hatching our salmon eggs: all these things, gentlemen, I consider as encouraging signs of progress. This, however, is not the subject on which I desire to speak to you this day; but I wish to ask the question, what is to be done in the future?

Our object is clear, even if we don't think of "*depecoration*"; it is *to increase the food for the people by producing large quantities of fish, with the smallest possible expense.*

To attain to this object, we must first direct our efforts to the migratory fish; secondly, we must make endeavors that our lakes, both large and small, from the proud Lake of Constance to the smallest pond in Lithuania, may produce as many and as good fish as their natural character and modern cultivation permit.

This is a grand object. We may never reach it entirely, but it is nevertheless our duty to aim at it with all our energy. Here is a wide field of action for the German Fishery Association.

I might give you an account of the deplorable condition of our rivers from the Memel to the Rhine; how, nearly everywhere, the salmon are prevented from ascending them; how there is scarcely a single spawning-brook without arrangements for catching the young fish; how numberless hogs are fed with young fish; but I will forbear. Gentlemen, our field is wide if we everywhere desire to remedy the existing state of affairs.

Among the migratory fish, to which, as I said before, we must first

direct our efforts, the salmon holds at present the first rank in public favor; and the German Fishery Association may well look with pride on its efforts in behalf of this fish. From the Memel to the Rhine there is scarcely a river or brook which has not during the last few years received young salmon, or may receive them if the inhabitants of the banks make the slightest effort to obtain them. As regards salmon-culture, Hüningen and Freiburg in the Breisgau hold the first places. If I am not mistaken, there exists a treaty between Baden, Alsace, and Switzerland, according to which the Hüningen establishment will annually place several millions of young salmon in the Rhine. Might a healthy change in the present legislation of the Rhine countries soon allow these young salmon to return undisturbedly to the spawning-brooks of the Upper Rhine; for it can scarcely be demanded that they shall all be caught by Dutch nets!

But, gentlemen, it is my object this day to speak to you of another migratory fish. It is true that the salmon is an ornament on any table; but it requires a great deal before it can become an article of food for the masses; and, besides, it requires great care for three or four months until it can be placed in the rivers.

The idea of introducing the shad in Germany, therefore, soon suggested itself, a fish which, as I said before, was particularly suited for artificial hatching. Attempts were made in this direction; the first, at my suggestion, by Mr. Roosevelt, and the second, at the suggestion of Dr. Lindemann, in Bremen, by Professor Baird. The object was almost obtained. One hundred thousand young shad, accompanied by competent persons, were sent over by Professor Baird, who desired to meet our wishes with his usual liberality. These fish reached the neighborhood of Southampton alive, but all died before they got to Bremen. Professor Baird thereupon proposed that we should get one of our swiftest war-steamers for transporting shad; but I must confess that I did not venture to ask our admiralty for a ship. Besides, I had formed another plan. Some time ago I mentioned the following as the experience of American pisciculturists: "There is always a risk in introducing foreign fish; people should first see what they have in their own country." And, gentlemen, it is my firm conviction that in Germany we have the cousin, yea, even the brother, of the shad in our *may-fish*. I am well aware that my learned friend Professor Peters has demonstrated the difference between *Clupea alosa* and *Clupea præstabilis;* these are the Latin names for may-fish and shad; but he will pardon me if I grant such a difference *scientæ*, but not *vitæ*, that is, as far as our tongue and eyes are to be regarded. To be entirely on the safe side, I had a may-fish from Wesel sent to the highest American authority on this side of the water; and the verdict returned by this table-jury, selected in a very practical manner, was, "Yes; this is our shad, in as far as the North Sea can give to it the flavor which with us it obtains from feeding on the rich pasture-grounds of the Gulf Stream." My reso-

lution was formed at once; our aim must be to increase the number of may-fish, just as the number of shad has been increased in America; to increase its number in the Rhine, and to place large numbers of young may-fish in the Weser and the Elbe, from both of which rivers they can go to the North Sea to seek their food. In both of these rivers it occurs occasionally, although there is no protection for it whatever.

The question remains to be answered whether the Baltic can supply sufficient food for this fish, and whether, therefore, the rivers flowing into the Baltic could be stocked with may-fish.

The attempts made during the last two summers to cultivate this fish were unfortunately not successful. All our efforts will remain very uncertain, unless we can induce the Dutch to make a short pause in their barring of the Rhine, at least for some hours every week during the season when these fish migrate. But this coming summer I cerfainly look for some successful results, since our energetic colleague, Mr. Eckardt, who has been so eminently successful in his piscicultural efforts, has promised to devote some weeks entirely to these experiments. He has succeeded in placing before us this day in this glass vessel which you see here hundreds of live *Blaufelchen* from the Lake of Constance and *Maræna*s from the Madue Lake. If we are successful, and why should we not hope for it? the may-fish will become with us, as the shad in America, a great benefactor of the masses of our population.

The highly praised American whitefish (*Coregonus albus*) also finds his near relation in the beautiful species of *Coregonus* which we have, the *Maræna* of the Madue Lake, the Schaal Lake, and the Puls Lake, as well as the *Blaufelche* of the Lake of Constance. We are able to chronicle fine results obtained in this direction during the last few months. Mr. Eckardt has succeeded in obtaining a large quantity of well-impregnated spawn of the Madue *maræna*, and he has distributed a good deal of it, so that some days ago we could place several thousands of the young fish in the Tegern Lake and the Lake of Constance. Mr. Haack, of Hüningen, could also report very encouraging results of the cultivation of the *Blaufelchen* in the Lake of Constance; and we succeeded in placing about 40,000 of these in this lake, and several thousands in the Tegern Lake. Thus you see, gentlemen, that we have not been altogether unsuccessful in the field of practical pisciculture, and if we have not been able to show as great results as America, it must be remembered that the educated classes have so far not taken any great interest in our efforts, and that the means at our command have been very small. Let us hope that there may soon be an improvement in both respects.

I may well say with a feeling of pride that in gentlemen like von dem Borne, Eckardt, Schuster-Freiburg, Haack-Hüningen, Brussow of Schwerin, Mohnike and Strauss of Stolp—just to mention a few of the more than one hundred and fifty German presidents of piscicultural institutions—we have the guarantee that Germany can emulate America in this respect. But this requires a good organization.

A central board, such as in America Professor Baird's commission, and in Germany the German Fishery Association, is by no means superfluous; but, if it is to be really useful, it requires the co-operation of numerous other associations, such as the State commissions in America.

I am happy to be able to report the formation of provincial associations in Prussia, as the one in the province of Prussia, with which we have already established friendly relations. Would it be hoping too much soon to see an association in every province, having its own hatching-house, distributing fish gratuitously, like the one in New York?

Is there no provincial officer among us who might be induced to take an active interest in the formation of such associations?

I am not sufficiently posted concerning such associations outside of Prussia; but I do not hesitate to consider Mecklenburg very fortunate in possessing in Mr. Brussow, of Schwerin, a gentleman who devotes careful attention to all the waters of his State, who endeavors to find the most suitable location for every species of fish, who is about to establish six salmon-ladders, who is just now urging the passing of an ordinance requiring every one who rents a fishery to put a certain number of young fish in his waters. His labor has, so far, been crowned with success, although the sum at his command is very small. The finest fish of the Lake of Constance, which he has raised in his hatching-house and placed in Mecklenburg lakes, have recently been caught there; and the specimens caught being particularly fine, shows that our more northern climate does not hinder their cultivation.

As far as Prussia is concerned, a great deal may be expected from the step which the royal forest administration is about to take. Pisciculture is to be taught theoretically and practically in both academies of forestry. Think what glorious results we will be able to chronicle when, in comparatively few years, every Prussian forest officer of a higher grade is skilled in the easy and remunerative process of stocking every sheet of water in his district with suitable fish.

Gentlemen, when I look over this large and illustrious assembly, when I see how the interest taken in our work is growing throughout the empire, which, among the rest, is shown by the fact that during the last three months our association has received sixty-one new members, I confidently expect that Germany will soon accomplish something in the field of pisciculture worthy of her name.

Gentlemen, I ask you to give us your assistance, either direct or indirect, by taking an interest in our work, and by favoring our efforts with your criticism. Might, above everything, those gentlemen who will today by this assembly be intrusted with the management of the affairs of the association in the future feel convinced that our great and beautiful German country has the right to demand that also in this respect its interests shall be furthered in the best possible manner.
